INTRODUCTION

TO

BLACK'S GENERAL ATLAS.

PHYSICAL GEOGRAPHY.

THE earth which we inhabit is only one of a number of globes or planets that revolve at various distances and in different periods round the sun as a common centre. Its orbit is elliptical, but differs little from a circle; and its mean distance from the sun is about ninety-five millions of miles, but it is 3,200,000 miles nearer that luminary at one period of the year than another. It performs its revolution in 365 days, 5 hours, 48 minutes, 50 seconds, the mean rate at which it travels being 68,000 miles an hour. Besides this motion round the sun, it has also a rotatory motion on its axis, which it completes every twenty-four hours, or, speaking more strictly, every 23 hours, 56 minutes, 4 seconds. To the former we are indebted for the changes of the seasons, to the latter for the alternation of day and night.

The earth is not strictly spherical in form, but is a little flatter at the poles than at any other part of its circumference—being what is termed an *oblate spheroid.* Its mean diameter is 7913 English miles—the equatorial exceeding the polar by 26 miles. For more conveniently and accurately determining the positions of places on the earth's surface, geographers have supposed certain lines or circles to be traced upon it. One of these, the *Equator*, equally distant from both poles (or points of rotation) divides the earth into the *Northern* and *Southern Hemispheres.* In like manner the *Eastern* and *Western Hemispheres* are marked off by an encircling line at right angles to the equator, and passing through the poles. Parallel to the equator, and numbered from it, are the *lines* or *degrees of latitude*, of which there are ninety in the northern, and as many in the southern hemisphere. The equator is divided into 360 equal parts, and lines drawn perpendicularly from the points of division to the poles constitute the *lines* or *degrees of longitude.* These are numbered east or west from a certain meridian, as that of Greenwich, Paris, Washington, etc. The *meridian* of a place is a line passing through that place to the poles at right angles to the equator. All places lying in the same latitude have equal length of day and night at the same time, while all places in the same longitude have mid-day at the same time. Degrees of latitude and longitude are of the same length at the equator, but on account of the flattening of the surface of the earth, the former elongate slightly towards the poles, while the latter diminish in length at the following rate, assuming a degree of longitude at the equator equal to 69.06 English miles:—

Lat.	Eng. Miles.	Lat.	Eng. Miles.	Lat.	Eng. Miles.	Lat.	Eng. Miles.
1°	69.05	6°	68 68	10°	68 01	50°	38.57
2	69.02	7	68.55	20	64.90	60	30.00
3	68.96	8	68.39	30	59.81	70	23.62
4	68.89	9	68.21	40	45.96	80	11.99
5	68.80					90	0.00

Each degree is divided into sixty equal parts, termed minutes, and every minute into sixty equal parts, termed seconds, marked thus ° ′ ″. On maps the latitude is denoted by figures at the sides, the longitude by figures at the top and bottom. The top of a map is the north, the bottom the south, the right hand the east, the left hand the west.

As the earth revolves round the sun with its axis constantly inclined to the plane of its orbit at an angle of 66° 32′, the sun is vertical at different times of the year to all that portion of the earth's surface lying between 23° 28′ N. and 23° 28′ S. of the equator. This region, being thus subjected to the greatest amount of heat, is called the *Torrid Zone*, and is bounded on the N. by a circle termed the *Tropic of Cancer*, and on the S. by another termed the *Tropic of Capricorn.* From this inclination of the earth's axis, it also happens that the whole region within 23° 28′ of either pole, or in other words above 66° 32′ of N. or S. latitude, is for a certain period of the year involved in continual night or continual day. The northern of these regions is termed the *North Frigid Zone*, and is bounded by the *Arctic Circle;* the southern, the *South Frigid Zone*, and is bounded by the *Antarctic Circle.* Between the Tropic of Cancer and the Arctic Circle is the *North Temperate Zone*, and between the Tropic of Capricorn and the Antarctic Circle is the *South Temperate Zone.* The *Ecliptic*, a circle marking the sun's vertical position as regards the earth, cuts the equator obliquely at two points, termed the *Equinoctial Points* or *Nodes;* and the sun being then vertical to the equator, half the northern and half the southern hemispheres have day and night at the same time, and day and night are of equal length all over the earth. The *Vernal Equinox* happens on the 21st of March, and the *Autumnal* on the 21st of September. The *Summer* and *Winter Solstices* are when the sun is at the greatest distance from the equator, or on the parallel of 23° 28′ N. or S. latitude. The summer solstice is on the 21st of June, when the sun is vertical to 23° 28′ N. latitude. The days are then longest and the nights shortest in the northern hemisphere, and within the Arctic Circle it is continual day, while within the Antarctic Circle it is continual night. On the 21st of December, when the sun enters the winter solstice, the reverse of this is the case; the sun being then on the parallel of 23° 28′ S. latitude, the days are longest and the nights shortest in the southern hemisphere, and continual night reigns within the Arctic Circle.

Atmosphere.—This earth is surrounded on all sides, and accompanied in all its movements by an invisible and highly elastic fluid, termed its Atmosphere. This fluid, which is retained by the influence of gravitation, has its greatest density upon the surface of the earth, diminishing by degrees as it ascends, till it is supposed to cease entirely at the altitude of about forty-five miles. Though light as compared with the more solid parts of the earth, yet as a whole it presses with great force upon the earth's surface, being at the rate of about fifteen pounds on every square inch, or nearly a ton on a square foot. It is composed principally of two gases, nitrogen and oxygen, in the proportion of about seventy-nine parts of the former to about twenty-one of the latter. Aqueous vapour is also present in varying proportion, and carbonic acid in the proportion usually of 1 to every 1000 parts. The atmosphere is the great sustainer of animal and vegetable life, the diffuser of light and heat, and the vehicle of sound and smell.

Winds.—Whatever disturbs the equilibrium of the atmosphere causes *a current of air* or *wind.* The principal cause of winds is solar heat. When a portion of the earth's surface is heated by the sun's rays to a higher temperature than the surrounding regions, the column of air resting upon it expands and rises until it reaches a part of the atmosphere of lower temperature than itself, when it becomes condensed. The air in the equatorial regions being thus heated by the sun's rays, ascends, leaving a space occupied by very thin air, into which colder and denser air from the poles rushes with great force to restore equilibrium, while the air which has been rarefied by the heat, seeks by an upper current to supply the place of that which has left the colder regions. There is thus a constant interchange of air between the polar and equatorial regions. Were the earth motionless, these currents would blow due N. and S., but on account of its rotatory motion, which, from being comparatively slow in the region of the poles, gradually increases in velocity to the equator, where it is at the rate of upwards of 1000 miles an hour, the polar currents in their course towards the equator, not having acquired the same velocity as the parts over which they are passing, gradually fall behind, and as the motion of the earth is from W. to E., they acquire an easterly direction, and become N.E. and S.E. winds. Within the limits of the torrid zone these winds are constant and uniform, and are known as the N.E. and S.E. trade winds. The *Trade Winds* generally extend to about 28° on each side of the equator, but their limits vary considerably in different parts; and being influenced by the temperature, they remove 2° or 3° farther N. or S., as the sun is N. or S. of the equator. It is only over a wide expanse of ocean that the trade winds can blow uninterruptedly, for the air over the land being much more heated by the sun's rays than that over the sea, the vicinity of continents or large islands disturbs their free course. It is thus that they blow more steadily in the Pacific than in the Atlantic Ocean. Between the N.E. and S.E. trade winds there is a region of *calms*, caused partly by the northern and southern currents meeting and mutually destroying each other, and partly also by the earth having, by constant friction on the air, imparted to it something of its own velocity. This region has a mean breadth of about 5° of latitude, but it varies considerably with the seasons and in different regions to 9° or 10°. In the Pacific Ocean, the mean situation of its centre is about the equator, but in the Atlantic Ocean, owing to the disturbing influence of the continents, it is usually about 6° N. latitude. This region is subject to sudden squalls, accompanied with tremendous storms of thunder and lightning. The *Monsoons*, or *Season Winds*, from a Malay word signifying a season, are a modification of the trade winds that prevail in the Indian Ocean. When the sun is north of the equator, an extensive inter-tropical region becomes heated by his vertical rays, and hence an upward atmospheric current is produced, while a cold current from the neighbouring ocean rushes in to occupy the place of the ascending current. Thus is caused the S.W. monsoon, which prevails for six months (from April to October); the N.E. monsoon, which blows during the rest of the year, being the regular N.E. trade wind. In the same way when the sun is south of the equator, the S.E. trade wind is interrupted from October to April by a N.W. monsoon, occasioned by the action of the sun on the great continent of Australia. The region of the monsoons is between the E. coast of Africa and New Guinea, and N. of about 10° S. latitude. The air, which has been rarefied by the sun's rays, having acquired its momentum in the equatorial regions where the rotatory motion of the earth is greatest, in its progress northward and southward gradually outstrips in velocity those parts of the surface over which it passes, and hence it receives a westerly direction all the greater, that in its course it has been little under the influence of surface friction, owing to the elevated region in which it has travelled. It again returns to the earth beyond the tropics, and is the origin of the S.W. and westerly gales, so prevalent in our latitudes, and of the almost universally westerly winds in the northern and southern extra-tropical seas. The *Land and Sea Breezes* are caused by the unequal heating of the land and

sea, and are chiefly experienced on tropical sea coasts. During the day, the air over the land becoming heated by the sun's rays, ascends, while a current from the sea sets in to supply its place. During the night, the reverse of this happens, for the land cooling by radiation more quickly than the sea, a land breeze is occasioned. As the hottest and coldest hours of the day are about two P.M., and a little before sun-rise, the winds in question acquire their greatest power somewhat later. Large deserts and plains covered with little vegetation near the tropics engender hot winds of a very noxious character. Some of these are known by particular names, as the *Sirocco*, which blows from the sandy wastes of North Africa, and is especially felt in Italy and Sicily; the *Solano* of Spain, which seems to be a modification of the Sirocco; the *Harmattan* of the west coast of Africa, blowing from the Great Sahara; and the *Simoom*. A current of wind blowing at the rate of four or five miles an hour, is called a gentle breeze; at the rate of fifteen miles an hour, a brisk gale; from thirty to forty miles an hour, a high wind; and from eighty to one hundred miles an hour, a hurricane.

Climate.—The principal elements that go to constitute climate are heat and moisture, the latter being dependent upon the former. The sun being the great source of heat, it follows, as a general rule, that the temperature of a place will depend upon its latitude or distance from the equator, and that all places in the same latitude will enjoy the same kind of climate. Were the surface of the earth composed of a homogeneous fluid mass, or of strata of rock perfectly alike in colour, density, and smoothness, this would actually be the case; for all places in the same latitude would receive the solar rays at the same angle, and having the same capacity for absorbing and radiating heat, would possess exactly the same climate. There are, however, numerous circumstances that tend to modify the climate of a country. The chief of these are its altitude; its position as regards the sea; its inclination; the position and direction of mountain chains; nature of soil; state of cultivation; and the prevalence of particular winds. Elevation above the level of the sea is one of the most important circumstances by which climate is modified, the air becoming gradually colder as we ascend, so that even in the torrid zone the summits of very high mountains are covered with perpetual snow. The following table shows the height of the snow line in different latitudes:—

Northern Hemisphere.				Southern Hemisphere.			
Place.	N. Latitude.		Limit of Per. Snow.	Place.	S. Latitude.		Limit of Per. Snow.
	°	′	Feet.		°	′	Feet.
Iceland	65	0	3,100	Straits of Magellan	53	0—54	0 3,700
Kamtschatka	56	40	5,200	Chili, Andes along the coast	41	0—44	0 6,000
Altai	50	0	7,000	Chili, Portillo Pass		33	0 14,700
Alps	46	0	8,800	Bolivian Andes, E. Chain	14 30	—18	0 15,900
Pyrenees	42	45	9,000	Bolivian Andes, W. Chain	14 30	—18	0 15,850
Sicily, Etna	37	30	9,500	Andes of Quito	0	0—1	30 15,800
Himalaya, N. Side	31	0	16,600	Quito		0	0 15,800
Himalaya, S. Side	31	0	13,000				
Mexico	19	0	14,800				
Abyssinia	13	15	14,100				
S. America, Volc. of Purace	2	18	15,400				

Another important element in determining the nature of climate is the ocean. Islands and districts bordering upon the sea uniformly enjoy a milder climate than inland regions in the same latitude. In summer the sea is not so much heated by the sun's rays as the land, and hence cooling sea breezes temper the warmth of that season, while in winter the cold is mitigated in consequence of the water retaining its heat longer than the land. Thus Dublin, though 4° further north than Heidelberg, has nearly the same mean annual temperature, while at the same time its winters are almost 6° warmer, and its summers nearly 5° cooler. As the power of the sun's rays in imparting heat to the earth depends upon the angle at which they strike the surface, it follows that the inclination or slope of a country has an important influence upon its climate. This is most strikingly seen in mountainous regions. Thus, though under a vertical sun, the sides of the Andes receive the sun's rays as obliquely as they fall in our latitudes upon the earth's level surface; and the Alps on parts of their southern slopes receive as direct a heat as that which burns up the desert of the Sahara. Mountains affect the climate in various ways by influencing the direction of currents and by attracting and condensing the vapours in the atmosphere. The nature of the soil and the state of cultivation operate materially upon climate. Different kinds of soil have different powers of radiating and absorbing heat. A region shrouded in primeval forests, or covered with swamps and marshes, will have a different temperature when cleared and drained. Marshes by evaporation rob the surface of much of its heat, and forests, by intercepting the sun's rays and by the increased exhalant surfaces exposed to the air, materially affect the temperature. In hot climates forests tend to cool the air, and in frigid regions to prevent the loss of the earth's heat by chilling blasts. The prevalence of particular winds also influences the character of a climate, as does also the vicinity of an oceanic current bringing water of a higher or a lower temperature than that of the surrounding sea.

Isothermal Lines (from ἴσος, "equal," and θέρμός, "heat") are lines drawn upon a map, and passing through all places that have the same mean annual temperature. From what has been already said, it will be inferred that these lines differ considerably from lines of latitude. They diverge more and more from the parallels of latitude as they recede from the equator. The southern hemisphere having much less land than the northern, especially in its torrid and temperate zones, its mean annual temperature is lower. In the American continent the isothermal lines descend much lower than in Europe. Thus the line of 32°, or the freezing point in Europe, lies in Lapland between N. lat. 66° and 68°, but in America it passes on the coast of Labrador in N. lat. 54°. Places which have the same mean annual temperature may yet have very different climates. A place having a moderate summer and winter temperature may have the same mean annual temperature, as one having a very cold winter and a very hot summer. Thus St. Helena has the same mean annual temperature as Lisbon, but its winters are 11° milder, and its summers 12° cooler. Hence recourse is had to other lines indicating the mean summer and winter temperature, the former called *Isotherals* (from ἴσος, "equal," and θέρος, "summer"), the latter *Isochimenals* (from ἴσος, "equal," and χειμών, "winter"). The torrid zone has but two seasons—the wet and the dry. The latter is considered as the summer and the former as the winter of the regions within this zone, but they are in direct opposition to the astronomical seasons, as the rains follow the sun. In some districts there are two rainy and two dry seasons; in others rain never or very rarely falls. In the temperate zones only is the year divided into the four seasons, exhibiting the agreeable vicissitudes of heat and cold, the varied charms of spring and autumn, the temperate heats of summer and the healthful rigours of winter. This regular succession of the annual changes, however, can hardly be considered to extend farther than from 35° to 60° of latitude. In the frigid zones two seasons only are known: a long and severe winter, followed by a short but fervid summer. This harsh and abrupt transition is occasioned by the great length of the day in summer, when the sun never sets, and by the total absence of that luminary in winter.

Ocean.—On glancing at a map of the world, we find that by far the greater part of its surface is occupied by water. The entire superficies of the globe is estimated at about 196½ millions of square miles, of which the land occupies about 50½ millions, and the water 146 millions, or nearly three-fourths. Though, strictly speaking, the water on the surface of the globe forms but one great ocean dividing the land into detached masses of various extent, geographers for convenience usually divide it into five:—The Pacific, Atlantic, Indian, Arctic, and Antarctic Oceans. The *Pacific Ocean* has Asia and Australia on the W. and America on the E., the Antarctic Ocean on the S. and Behring Strait on the N. It is about 11,000 miles in length from E. to W., by about 9000 in breadth from N. to S. and has a superficies estimated at upwards of 50,000,000 square miles. It is divided by the equator into the North and South Pacific Oceans. The *Atlantic Ocean* has America on the W., and the Old World on the E., the Arctic Ocean on the N., and the Antarctic Ocean on the S. It is about 9000 miles in length from N. to S., by 1700 miles in width at its narrowest part between Africa and America, and about 5000 where widest. Its computed area is about 25,000,000 square miles. It is divided by the equator into the North and South Atlantic Oceans. The *Indian Ocean* has Arabia, Persia, and Hindostan on the N., the islands of the Eastern Archipelago and Australia on the E., Africa on the W., and the Antarctic Ocean on the S. It is upwards of 7000 miles in length from N. to S., and varies in breadth from 6500 to 3500 miles. Area estimated at about 20,000,000 square miles. Of the *Arctic* and *Antarctic Oceans*, especially the latter, comparatively little is known. The former is bounded by the northern coasts of Europe, Asia, and America, the latter enclosed by the Antarctic Circle, has no land boundaries, its waters communicating freely with those of the other southern oceans.

The bed of the ocean, like the surface of the land, has its hills, mountains, valleys, and plains. Of its depth little is known, except that it varies from a few feet to several miles. We have indeed had soundings to the depth of seven, eight, or even of nine miles; but soundings in very deep water are little to be depended on, as the under currents of the ocean have frequently force enough to take out the line long after the plummet has ceased to do so; and the shock caused by striking the bottom cannot be communicated through very great depths. Some suppose that the greatest depth of the ocean does not exceed the height of the loftiest mountain (or about 30,000 feet), and that its mean depth is not greater than the mean elevation of the land above the level of the sea, which is somewhat less than 1000 feet. Others consider that the depth of the ocean is proportioned to the elevation of the land, in the ratio of their respective surfaces. This would give the greatest depth of the ocean at about seventeen miles, and its mean depth at somewhat more than half a mile.

The waters of the ocean are kept in perpetual motion by winds, tides, and currents. The effect of winds in agitating the ocean is chiefly confined to the surface. It is believed that, in the open sea, the wildest tempest does not affect the water at the depth of 100 feet. On the surface, however, the action of the wind is sometimes very violent, raising waves in the open sea to the height of about forty feet, and when these meet with resistance, as where they dash upon lofty cliffs, they rise apparently in one unbroken mass to the height of 200 feet. The alternate rise and fall of the surface of the ocean, known by the name of *Tides*, are occasioned by the influence of the sun and moon, particularly of the latter. The moon in passing over the earth draws after it, by its attractive force, an accumulation of the water of the ocean; and not only so, but the earth itself is also to some extent attracted and drawn away from the waters on the opposite side, and hence a similar accumulation is at the same time formed there. We have thus tides on opposite sides of the earth at one time, and two tides all over the earth in somewhat more than 24 hours (24 hours, 50 minutes). The effect of the sun in causing the tides is much less than that of the moon, in consequence of its much greater distance. It is principally as affecting the lunar tides that this influence is seen. When the sun and moon are on the same or opposite sides of the earth, as at new and full moon, the attraction of the sun aids that of the moon, and hence, at these seasons, the tides attain their greatest height and are called *Spring Tides*. But when the moon is in quadrature, or at the half-moons, the attraction of the sun to some extent counteracts that of the moon, and hence the tides do not then rise to their ordinary height, and are termed *Neap Tides*. In the open ocean, the tides do not rise more than a few feet, but when the configuration of a coast opposes their progress, they may attain the height of fifty feet, as at St. Malo, or even of seventy feet, as in the Bay of Fundy. Inland seas, like the Mediterranean, or the Baltic, have no perceptible tides. *Oceanic Currents* are vast marine streams, flowing in different directions, and maintaining a perpetual circulation in the waters of the ocean. The causes of these currents are as yet only imperfectly understood, but among them may be enumerated the influence of the tides and winds, the expansion and contraction of the water by heat and cold, evaporation by solar heat, and the revolution of the earth upon its axis. They are by Major Rennel divided according to their origin into *drift* and *stream* currents, the former occasioned by a constant or prevailing wind acting on the surface of the water, and impelling it onward, until meeting with some obstacle which stops it, and causes an accumulation; the latter is the flowing off of the accumulated waters of a drift current, caused by the effort of the water to restore the equilibrium of the general surface of the ocean. Oceanic currents exercise an important influence on the climate of neighbouring coasts and on the intercourse of nations.

Land.—The land on the surface of the globe is arranged in the form of large, compact masses, denominated continents, or in small isolated portions, termed islands. It lies chiefly north of the equator, and in the Eastern Hemisphere. In the Eastern Hemisphere there are estimated to be about 36 millions of square miles of land, and in the Western Hemisphere about 14½ millions; there are about 37 millions of square miles in the Northern, and about 13½ millions in the Southern Hemisphere. In the Western Hemisphere the land is much more equally distributed on both sides of the equator than in the Eastern. There are only two large masses of land to which the term continent can be properly applied. These are the Eastern, or *Old Continent*, comprising Europe, Asia, and Africa, and the Western, or *New Con-*

tinent, including North and South America. The vast extent of Australia has induced some geographers to consider it as a continent; but it may more justly be reckoned as the largest of the islands. It is sometimes, together with the numerous and extensive islands lying to the S.E. of the Old Continent, ranked as one of the great divisions of the globe, under the name of *Oceania*, or *Polynesia*.

The surface of the land is extremely irregular, sometimes elevated into mountains, sometimes depressed into valleys, and not unfrequently stretched out into plains, varying in extent and elevation. The term *Mountain* is generally applied to eminences whose height exceed 1000 feet, those of less elevation being generally considered as *Hills*. Isolated mountains of great height are of rare occurrence, and are usually active or extinct volcanoes. Hills and mountains generally appear in *chains* or *ranges*, connected together by a continued base, and forming a line or belt. Several chains connected together by a common centre constitute a *group*, and several groups or chains form a system. In general, a number of chains is associated together; a single continuous chain is rarely met with. In some instances there is a principal or central chain, with secondary groups branching off from it; in others several chains are associated, to no one of which the others can be said to be subordinate; and in others, as the Cordilleras, a series of chains succeed each other, all running in one constant direction. The predominating direction of the great mountain-chains of the Old World is from W. to E., while those of America range from N. to S. It is observed, that in general mountain-chains present their steepest acclivities on the side nearest the sea. Compared with the dimensions of the earth, the elevation of the loftiest mountain-chain is quite insignificant. Mount Everest, the loftiest known mountain, is 29,002 feet, or about five and a half miles above the level of the sea, but this is only about a seven hundred and twentieth part of the earth's radius. *Table-lands*, or *Plateaus*, are extensive tracts of country whose general elevation is considerably above the level of the sea. The exterior boundaries of table-lands are generally mountain-chains, in some cases descending suddenly and abruptly into the surrounding plains, in others forming a succession of mountain-terraces at different levels, until they are lost in the adjacent lowlands. *Plains* are extensive tracts, whose surface is level, or but slightly broken by elevations and depressions, and only slightly elevated above the level of the sea. In one or two cases, however, they are considerably below the sea-level, as in the depressed region round the Caspian and the Sea of Aral. In different countries, and according to their nature or productions, they are characterised as *deserts, steppes, landes, selvas, pampas, llanos, prairies, savannahs*, etc. *Valleys* are the spaces lying between mountain-chains or ranges of hills. They are sometimes wide and open, at other times deep and narrow, and sometimes basin-shaped, surrounded by an amphitheatre of hills or mountains. Valleys are of different kinds, according to their respective relation to the mountain-ranges on which they occur. *Principal valleys* are such as run parallel to, and separate great chains of mountains. Those separating the branches or arms of a mountain-chain, and having a direction at a considerable angle to the principal valley, are termed *lateral valleys*; and the smaller ones running into these lateral arms, are denominated *subordinate valleys*.

Distribution of Plants.—The surface of this earth is covered with vegetation which constantly varies in nature and character according to climate and locality. Heat is a principal necessary of vegetable life, and the one chiefly concerned in the geographical distribution of plants. Some plants require great heat to bring them to perfection, and some flourish best in cold situations. Some require a long winter for repose, and only a few weeks of warm and continued summer; while others succeed only in a climate where both seasons are moderate. Moisture is another agent which exerts a powerful influence on the distribution of plants, and one absolutely necessary to vegetation. Very dry regions are deficient in vegetable productions, while the luxuriance of tropical vegetation is in no small degree owing to the great quantity of moisture that prevails. Light is also of the utmost importance to vegetation, and is concerned in the various functions of plants. The character of the soil also regulates the distribution of plants. Some plants are very generally distributed over the globe, occurring in both hemispheres and having an extensive latitudinal range; and some are limited to particular countries, and are sometimes confined within very narrow limits. The floras of the different quarters of the world contain certain plants which are restricted to them, and some which are only found in a few localities. We sometimes meet with centres where the maxima of a genus or species occur, the numbers of which diminish as we recede from these centres. The number of species of plants, described and undescribed, known at the present day, amount probably to nearly 120,000; and from this, estimates have been made of the total vegetation on the surface of the globe, the number varying from 150,000 to 200,000. It is estimated that there are 9150 genera, and 96,000 species of known and described plants, of which 1400 genera and 15,000 species are Acotyledonous or plants whose embryo has no cotyledons but is entirely cellular, as ferns, fungi, lichens, mosses, sea-weeds, etc. The rest are Cotyledonous plants possessing cotyledons in their embryo, and are either Monocotyledonous having one, or Dicotyledonous with two, the former comprising 1450 genera and 14,000 species, the latter 6300 genera and 67,000 species. To the former class belong palms, rushes, grasses, liliaceous plants, etc.; to the latter, the forest trees and shrubs of temperate and cold zones, many herbaceous plants, etc. The relative numerical proportion of these great classes of plants varies in different parts of the world. In equatorial regions, monocotyledons are to dicotyledons in the proportion of 1 to 5 or 6; in temperate regions, as 1 to 4; and in arctic regions, as 1 to 3. An equable temperature and a rather humid climate are favourable to monocotyledons. They diminish both under the extreme cold of the arctic zone and the great heat of the tropics. The cryptogamic or flowerless plants are to the phanerogamous or flowering as 1 to 7.

As heat is the principal agent in regulating the geographical distribution of plants, we naturally expect to find a variety of zones of vegetation as we proceed from the equator towards the poles. Such indeed is the case, and various attempts have been made to define these zones. That commonly adopted divides each hemisphere into eight zones or belts, corresponding with the parallels of latitude; though, to be strictly correct, they should be according to the isotherms of the particular month in which there is the greatest development of vegetable life. These zones of vegetation are:—1. The *Equatorial*, characterised by the palm and the banana, and extending to 15° on both sides of the equator; 2. The *Tropical*, or region of the tree-fern and fig-tree, from lat. 15° to the tropics; 3. The *Sub-tropical*, or region of myrtles and laurels, from the tropics to lat. 34°; 4. The *Warmer Temperate*, or region of ever-green trees, from lat. 34° to 45°; 5. The *Colder Temperate*, or zone of European trees, from lat. 45° to 58°; 6. The *Sub-arctic*, or region of the pine, fir-tree, and willow, from lat. 58° to the polar circle; 7. The *Arctic*, or region of rhododendrons, from the polar circle to lat. 72°; and 8. The *Polar*, or region of Alpine plants, beyond lat. 72°. As we ascend from the plain to the top of a mountain, we pass through different zones of vegetation, the extent and variety of which differ in different countries. Tournefort, in ascending Mount Ararat, was struck with the circumstance that as he left the low ground at the base of the mountain, he passed through a series of belts of vegetation which reminded him of what he had seen in travelling from the south to the north of Europe. At the base, the flora was that of Western Asia; higher, that of the countries on the north of the Mediterranean; then that of central Europe; and on the summit, he found the plants of Lapland.

Distribution of Animals.—Animals are distributed over the globe on principles similar to those which regulate the distribution of plants. Heat, light, and moisture, each play an important part in determining the distribution of animals. Some require a high degree of heat, others thrive under great cold; some live in water or marshes, others on dry land; some inhabit dense forests, others the open country. Animals, too, have the power of locomotion, and deriving their subsistence from plants or other animals, have to seek out those places in which their food is to be found. Man also greatly modifies the distribution of animals, extirpating or driving away the larger and more noxious species, and collecting around him those that may be serviceable either for food or labour, while by his pursuits he removes the aliment of some, and thus destroys or banishes them, but provides the natural aliment of others which are thus collected around him. Such are some of the causes that regulate the distribution of animals; but there are others which are less understood. The total number of existing species of animals has been estimated as follows:—

VERTEBRATA (Mammifera, or animals that suckle their young, 1200; Aves or Birds, 6800; Reptiles and Amphibia, 1500; Pisces or Fishes, 8000) . . .	17,500
ANNULOSA (Insects, 550,000; Vermes or Worms, 2500)	552,500
MOLLUSCA (Radiata or Star-fish, 1000; Polypi or Corals, 1500; Mollusca, naked, 600, with shells, 4400—5000)	7,500
	577,500

Many species of animals are almost universally diffused, but the greater number are confined to particular regions. Some are peculiar to the tropics, others are confined to the temperate zone, while not a few are constituted to subsist only within the polar circle. Some animals, though pretty generally diffused, yet attain their greatest development in hot climates, others in cold, and others in temperate. Thus the feline or cat tribe diminish in size and strength as they recede from the tropical regions; while, on the contrary, the bear and the anseres or goose tribes increase towards the poles; and the ox and sheep, natives of temperate regions, degenerate both toward the poles and the equator. For further particulars regarding the distribution of animals we must refer to the maps, where the subject can be studied with greater advantage than from any description.

Man.—Man, the highest in the scale of animal creation, has the power of living in any climate; he can endure the greatest heat and can protect himself in the severest cold. Hence he is the most widely distributed of all animals. It is impossible to arrive at anything like a satisfactory estimate of the population of the world, as the greatest discrepancies prevail among those best qualified to form an opinion. The following are a few of the estimates by well-known names:—Malte-Brun (1810), 640,000,000; Graberg (1813), 686,000,000; Pinkerton (1804), 700,500,000; Balbi (1816), 704,000,000; Balbi (1843), 739,000,000; Bernoulli (1840), 764,000,000; Hassel (1824), 938,000,000; Stein (1833), 872,000,000; Berghaus (1842), 1,272,000,000; Von Klöden (1859) 1,360,000,000.

EUROPE.

THIS division of the globe forms the N.W. portion of the Eastern Hemisphere or Old World, and is situate between 36° and 71° N. lat. and 9° 30′ W. and 60° 30′ E. long.; being bounded on the N. by the Arctic Ocean; W. by the Atlantic Ocean; S. by the Mediterranean, the Sea of Marmora, the Black Sea, and the mountain-chain of the Caucasus; and E. by Asia, from which it is separated by the Caspian Sea, the Ural River and Mountains, and the River Kara. Its greatest length in a N.E. and S.W. direction, from the mouth of the Kara in the Arctic Ocean to Cape St. Vincent in the S.W. of Portugal, is about 3400; and its greatest breadth, N. and S. from Cape Nord Kyn to Cape Matapan, 2400 miles. Area, estimated at 3,595,000 square miles. Its N.W. and S. sides are deeply indented by seas, bays, and gulfs. The chief of these are—the White Sea with the Gulf of Onega, Archangel, and Kandalask, extending southward from the Arctic Ocean into Russia, and having a length of about 400, and a breadth of from 30 to 150 miles; the Baltic, with the Gulfs of Bothnia and Finland, surrounded by Sweden, Russia, Prussia, and Denmark, and having a length of about 1200 miles, and an area of 175,000 square miles; the Mediterranean, with the Gulfs of Lyons and Genoa, the Adriatic, and the Archipelago, forming the S. boundary of Europe, and having an area of nearly 1,000,000 square miles; the Sea of Marmora, between the Archipelago and the Black Sea, 170 miles in length by 55 in breadth; the Black Sea, 700 miles in length by 380 in breadth; and the Sea of Azoff, 230 miles in length by 110 in breadth.

Europe is the smallest, but at the same time the most civilised, and in proportion to its size the most populous, of the great divisions of the earth. At first sight it seems to be less favoured by nature than any of the others. Much of its surface is rocky and mountainous, its vegetable productions are neither very various nor exuberant, it is poorly supplied with the precious metals, and its rivers cannot be compared with those of Asia and America, which open up the remoter regions of these continents to commercial enterprise. On the other hand, however, it has proportionally the greatest extent of coast line (estimated at 17,000 miles), is abundantly supplied with those metals and minerals most essential to the wants of civilised life, and has a climate well adapted for the development and vigorous action of the various faculties of man. The very disadvantages of its soil and cli-

mate have excited the industry of its inhabitants, and called into existence that skill and enterprise for which its people are distinguished.

Surface.—Nearly two-thirds of Europe consist of an immense plain, with occasional but small elevations upon it, the remaining third being partly mountainous and partly hilly. Towards the E. this plain extends across the whole continent, from the Arctic Ocean on the N. to the Black Sea and the Caucasus on the S.; and stretches from the Ural Mountains on the E. to the shores of the Baltic on the W., and even to the Atlantic opposite to the S. of Great Britain.

Mountains.—The mountainous and hilly portions of Europe, constituting the remaining third, lie chiefly in the S. and S.W. and N.W. parts of that continent. In the N.W. are the Scandinavian Alps, called also the Dovrefeld or Dofrines, extending about 1000 miles in length and having a general elevation of from 3000 to 6000 feet, though some of the summits attain a height of 8000 feet. The Alps form the nucleus of the great mountain system of Southern Europe. They take their rise from the southern part of the valley of the Rhone, along the eastern side of which they extend for about 150 miles. At the S. extremity they turn round towards the E., skirt the shore of the Mediterranean, and then bending to the S.E., they stretch along the Italian peninsula, where they take the name of the Apennines. Another chain, at the distance of 150 miles from the Mediterranean, extends eastward from the valley of the Rhone for about 300 miles, and then separates into two chains, the one, called the Noric Alps, extending towards the N.E., and the other the Carnic Alps, stretching in a S.E. direction along the eastern shore of the Adriatic, and taking in the S. the name of Pindus. Considerably to the N. of the Archipelago, a branch of the Carnic Alps, called the Balkan Range, extends eastward towards the Black Sea. The Alps attain their highest elevation towards their western extremity, where they approach the valley of the Rhone. Mont Blanc, the most elevated point, reaches the height of 15,744 feet. Nearly parallel to the Carnic Alps, but at a distance averaging 400 miles towards the N.E., is the Carpathian chain, about 1200 miles in length, but of no great height, the loftiest summit, Lomnitz in Hungary, rising to the height of 8460 feet. The chain next in elevation to the Alps is the Pyrenees, extending in a direction S.S.E. and N.N.W. between France and Spain for about 270 miles; but if we include the Cantabrian Mountains, which continue without interruption in the same line, the whole length will be about 500 miles. The principal summit, Maladetta, rises to the height of 11,168 feet. There are several lofty mountain-chains in Spain, the principal of which, Sierra Nevada, has its highest point, Mulhacen, 11,678 feet above the level of the sea. The great chain of the Caucasus, which forms the S.E. boundary of Europe, extends from a tongue of land called the peninsula of Taman, which separates the E. part of the Sea of Azoff from the Black Sea, in a S.E. direction along the N.E. coast of the Black Sea, and across the isthmus till it terminates in a series of low hills in the peninsula of Apsheron on the Caspian. It is about 700 miles in length, and varies in breadth from 65 to 150 miles. The loftiest summits are near the middle of the chain; Mount Elburz, the highest peak, being 18,491 feet above the level of the sea. The Ural or Uralian Mountains, which form the N.E. boundary of Europe, extend southward from the Arctic Ocean through 18 degs. of latitude. They rise almost imperceptibly from the plains on both sides, and are generally of no great elevation, though some of their peaks exceed 5000 feet in height.

Rivers.—Europe is well watered with rivers, but they are all small in comparison with the mighty streams of Asia and America. The largest is the Volga, which rises at about lat. 57° N., long. 33° E., at an elevation of only 560 feet above the level of the Caspian into which it flows. It is about 2000 miles in length, draining an area of 400,000 square miles, and is navigable for nearly its entire length. The Don, which flows into the Sea of Azoff, has a course of about 990 miles, but has so many shallows as to be nowhere navigable for large vessels. The Dnieper has a course of upwards of 1200 miles to its mouth in the Black Sea, and is navigable from Smolensk to Ekaterinoslav, but below that, for about fifty miles, the navigation is interrupted by rapids. The Dniester has its source in the Carpathian Mountains, in Galicia, and falls into the Black Sea after a course of about 500 miles. It is in most parts shallow and rapid, and is hence difficult of navigation. The Danube, the largest river in Europe after the Volga, is formed by the union of the Brege and Brigach at Donaueschingen, in Baden, at an elevation of 2186 feet above the level of the sea. Its course is at first generally E.N.E., through an alpine country, to Ulm, where its elevation is 1400 feet. From Donauwörth to Passau, it traverses the Bavarian plain, and from the latter town to Vienna it passes through a second mountainous region. At Vienna it is 450 feet above the level of the sea, and thence its course, to its mouth in the Black Sea, is through a country generally flat, except at the pass called the *Iron Gate*, a short distance below Orsova. The entire length of the Danube is about 1750 miles. It becomes navigable at Ulm, 1500 miles from its mouth, and steamboats ply regularly between Presburg and Constantinople. It communicates with the Elbe and the Rhine by canals, and the rivers Moldau and Altmühl. It drains an area of about 250,000 square miles, and receives about sixty navigable rivers. The most important of the other rivers draining the southern slope of Europe are the Po, the Rhone, and the Ebro, having respectively a length of 450, 520, and 420 miles. The Garonne, Loire, and Seine, belong to France. The Rhine, an important river of Germany, rises in Switzerland, by the union of three branches, in the Canton Grisons, the principal of which, the Vorder-Rhein, rises in a small lake on the E. side of the St. Gothard. It receives the Mittel-Rhein at Disentis, and joins the Hinter-Rhein at Reichenau, near Chur, and passing through Lake Constance, divides Switzerland from Germany, and afterwards forms the boundary between the latter country and France. It thence flows through the German States, and enters the Netherlands, where it divides into several branches, and then flows into the North Sea. It is about 750 miles in length, and is navigable to Basle. The Elbe takes its rise on the Schneekoppe, the loftiest summit of the Riesengebirge, in Bohemia, and flows generally N.W. through Bohemia, Saxony, and Prussia, separates Hanover from Mecklenburg, passes Hamburg, forms part of the southern boundary of Denmark, and falls into the German Ocean near Cuxhaven. It is about 650 miles in length, and is navigable for small vessels as far as Melnik, in Bohemia, but its mouth is encumbered by sandbanks, so that only vessels drawing not more than fourteen feet water can at all times come up to Hamburg. The Oder, an affluent of the Baltic, rises in Moravia, about fifteen miles E. of Olmutz, flows generally N.W. through Prussian Silesia, Brandenburg, and Pomerania, traverses the Stettiner Haff, and enters the Baltic by three mouths. It is about 500 miles in length, is navigable for vessels of forty or fifty tons as far as Breslau, and is connected by canals with the Havel, the Spree, and the Vistula. The Vistula, another tributary of the Baltic, rises in the Carpathian Mountains, in Austrian Silesia, flows through Poland and West Prussia, and divides into three branches, two of which, the Nogat and Old Vistula, flow into the Frische Haff, while the main stream, turning westward, flows into the Baltic near Dantzic. It is 600 miles in length, and is navigable for about 300 miles. The Düna, or Southern Dwina, rises in the Valdai Hills, near the sources of the Volga, with which it is connected by a canal, and flows first S.W., and afterwards N.W., to its mouth in the Gulf of Riga, seven miles N.W. of the town of that name. It is about 550 miles in length, and is navigable for nearly its entire extent. The Northern Dwina is formed by the union of the Soukhona and Joug, flows into the White Sea by several mouths, after a course of about 350 miles. It is navigable to Vologda.

Climate.—Europe, with the exception of a comparatively small part in the north, being wholly within the temperate zone, experiences little of the extremes either of heat or cold. Its mean temperature is also considerably higher than that of any of the other great divisions of the globe in the corresponding latitudes. This is no doubt chiefly owing to its numerous inland seas, bays, and lakes, and to the influence of the Gulf Stream. The mean temperature at its southern extremity, in latitude 36°, is about 66° Fahr., and at Cape North, in latitude 71°, it is about 32°, the cold being there not greater than in the latitude of 55° or 56° on the E. coast of Asia or America. There is a great difference between the temperature of the sea coasts of Europe and the interior. As we advance from the coast eastward, the mean annual temperature diminishes, but the heat of summer and the cold of winter increase. Thus, London has the same mean annual temperature as Vienna, but it has the summer of St. Petersburg, and the winter is warmer than at Milan. The following table shows—I. The mean temperature of the year and of the various seasons in places having the same latitude; II. The different distribution of heat through the various seasons, in places having the same mean annual temperature.

	Places.	Mean Temperature.						
		Of the Year.	Winter.	Spring.	Summer.	Autumn.	Warmest Month.	Coldest Month.
I.	Lat. 56° 0′ Edinburgh	47.8°	38.6°	46.4°	58.2°	48.4°	59.4°	38.3°

	53° 5′ Prague	49.4	31.4	47.6	68.9	50.2		

Vegetable Productions.—Europe does not present those extremes of luxuriance or sterility that are to be found on the other great Continents. It possesses a soil that requires, but at the same time that rewards, the labour of the husbandman. Many of the plants domesticated here are natives of other regions, and there are not very many tropical plants that cannot be made to grow here. The sugar-cane, one of the most valuable of tropical plants, grows in Sicily and the south of Spain. Cotton is cultivated in various parts of the south of Europe, and the orange and lemon come to perfection in the sheltered valleys of the W., as far N. as 43° 30′. The olive ceases at about 44°. The climate proper for maize is found to terminate on the W. coast of France at 45° 30′, on the Rhine at 49°, and on the Elbe at 50° or 51°. Rice has nearly the same geographical range, but requires a peculiar soil and situation. The culture of the vine extends as far N. as 47° 30′ on the Atlantic; on the Rhine to 50° 30′; and on the Oder to 52°. The parallel of 57° or 58° may be regarded as the northern limit of the cultivation of wheat in Europe, though it is raised in some favoured spots in Finland as far N. as 60° or 61°. The hardier cereals, rye, oats, and barley, are cultivated in some sheltered situations on the coast of Norway as high as latitude 69° 55′, but on the E. side of the Norwegian mountains these grains will scarcely ripen in 67° or 68°, and farther E., in Russia, it has been found impossible to carry cultivation of any kind beyond 60° or 62°. Barley, which accommodates itself better than any other grain to these high latitudes, by shortening the period of its growth, is sown and reaped within the space of seven or eight weeks. If we draw a curved line from a point in the Uralian Mountains, about latitude 60° or 61°, to the W. coast of Norway, in latitude 69°, passing through Lake Onega, and a little to the N. of the Gulf of Bothnia, this line will mark the extreme limits of its cultivation, and will cut off a space equal to nearly one-seventh of Europe. The cultivation of rye, oats, and barley, is confined to the region south of this line, and includes more than five-sixths of Europe; but in the N. parts of this zone, only a very small proportion of the land will bear corn. The region adapted to the cultivation of wheat comprehends about four-sevenths of Europe, and includes all the densely peopled parts. The region of the vine extends over three-sevenths of Europe. Throughout the southern, middle, and westward districts, to the sixteenth parallel of latitude, the plane, chestnut, walnut, poplar, oak, ash, beech, and other timber trees, come to perfection; and up to the sixty-seventh degree of latitude, the pine and birch continue to flourish.

Animals.—The animal kingdom of Europe is less varied than the vegetable. The most formidable wild animals are the white bear, peculiar to the Arctic regions; the brown bear, still common in the Alps, Pyrenees, and other remote mountainous and wooded districts; the wolf, still inhabiting many parts of Europe; and the wild boar. The reindeer abounds in Lapland, and forms the chief wealth of the inhabitants, but it can scarcely live south of 65° N. latitude. The elk frequents Lithuania, and parts of Norway, Sweden, and Prussia, but is seldom found farther north than 64°. In Central Europe are the red-deer and roebuck, and in the Alpine regions the chamois and the ibex. Among the other wild animals are the lynx, met with chiefly in the S., the wild cat, fox, otter, beaver, pole-cat, glutton, lemming, porcupine, hedgehog, hare, rabbit, squirrel, weasel, etc. The domestic animals comprise the horse, cow, camel (in the S.), ass, mule, sheep, goat, pig, dog, and cat. The birds of Europe are much more various than the quadrupeds. Above 400 species have been described as belonging to Europe, besides many occasional visitants. The northern regions are characterised by the multitude of aquatic birds. The birds of Europe, in general, are deficient in that brilliancy of plumage that characterises those of tropical climates, but they excel all others in the sweetness of their notes. Reptiles are not numerous, and few of them are either large or venomous.

Mineral Productions.—If nature has denied to Europe the precious metals in any very great quantity, their absence has been fully counterbalanced by the presence

of iron, coal, salt, copper, tin, lead, and mercury, in perhaps greater abundance than in any other region of similar extent. Iron and salt are pretty generally diffused. Coal is most plentiful in W. Europe, especially in Britain. Copper is widely distributed, but is most abundant in the N. and W., in the Ural and Dovrefeld Mountains, and in the extreme W. counties of England. Tin is found only in a few places; the mines of Cornwall are the richest in the world. Lead exists in the Alps, Carpathians, Pyrenees, Cevennes, Vosges, Uralians, and in Britain. Mercury, like tin, is confined to a few places; the mines of Idria are the most productive in Europe. Gold is widely diffused, but generally in so small quantities as not to repay the expense of working. It is wrought, however, in the Uralians, the Carpathians, the Dovrefeld, and the Alps. Silver is more abundant, but is less widely distributed than gold. Mines of it are wrought in the Erzegebirge, Carpathians, Uralians, and Dovrefeld. Antimony, zinc, cobalt, platina, manganese, arsenic, and nearly all the other metals, are to be found within the limits of Europe. Of the various mountain-chains, the Apennines are the poorest in metals; the Carpathians probably the richest.

The principal States of Europe, with their areas and populations at the latest dates, are as follows:—

States.	Area in Sq. Miles.	Date.	Population	States.	Area in Sq. Miles.	Date.	Population
Anhalt Bernburg	316	1861	57,811	Marino, San	24	1858	8,000

The Countries of Europe are—England, Scotland, Ireland, France, Spain, Portugal, Germany, Austria, Prussia, Switzerland, Holland, Belgium, Denmark, Norway, Sweden, Russia, Turkey, Greece, Italy, each of which we shall now separately notice.

ENGLAND AND WALES.

England and Wales occupy the southern, and by much the larger portion of the island of Great Britain, and are situated between latitude 50° and 55° 47′ N., and longitude 1° 46′ E. and 5° 41′ W. They form an extensive triangular peninsula, bounded on three sides by the sea, and separated from Scotland on the N.W. by a line, which extends from the N.E. extremity of the Solway Firth to the mouth of the River Tweed. Length, from Berwick to Land's End, 430; breadth, from 67 to 430 miles; area, 58,320 square miles, or 37,324,915 statute acres. The coast-line, following the principal indentations, is fully 2000 miles. The country is generally level, though it is traversed in different parts by ridges of considerable elevation. In the N. and W. the surface is elevated and hilly, is generally undulating in the centre, and in the E. consists of alluvial plains and low marshy ground.

Mountains.—The principal mountain-chains are the Pennine, Cumbrian, Cambrian, and Devonian ranges. The first of these extends from the Cheviots, on the Scottish border, southward to near Derby, occupying the W. portion of the counties of Northumberland, Durham, and York; the E. portion of Cumberland, Westmoreland, Lancashire, and Chester, and the middle part of Derbyshire. Its principal summits are Cross Fell, in Cumberland (2901 feet); Great Whamside, in the N.W. of Yorkshire (2384 feet); Ingleborough, in Yorkshire (2368 feet); and Pen-y-Gant, in Yorkshire (2270 feet). The Cumbrian group of mountains occupies the central and southern portions of Cumberland, the western and largest portion of Westmoreland, and the northern and insulated portion of Lancashire. This group comprises several of the loftiest summits in England, as the Helvellyn (3055 feet), Scafell (3166 feet), Skiddaw (3022 feet). The mountains are mostly bold, steep, and rugged, intersected by deep and narrow glens, many of which contain lakes; and the district is particularly noted for the romantic beauty of its scenery. The Cambrian Mountains extend on the W. side of the kingdom, from the Irish Sea to the Bristol Channel, and occupy nearly the whole of Wales. Of these, the Snowdon range is the chief, the principal summit of which rises to the height of 3571 feet. The Devonian chain stretches through the S.W. peninsula of England, between the Bristol and British Channels, and includes the hills of Devon, Somerset, and Cornwall. Its principal summits are Cawsand Hill (1782 feet), Dunkerry Beacon (1668 feet), and Rippon Tor (1549 feet).

Rivers.—The most important, though not the longest river of England, is the Thames, which rises in the Cotswold Hills, in Gloucestershire, under the name of Isis, and after being joined by the Thame, takes its proper name, and flows generally eastward, till it discharges itself into the German Ocean, by an estuary fifteen miles in width at its mouth, after a course of 215 miles. The Severn rises in a small lake in Montgomeryshire, on the E. side of Plinlimmon, and flowing through the counties of Salop, Worcester, and Gloucester, discharges itself into the Bristol Channel, after a circuitous course of about 240 miles through a beautiful and fertile country. The Trent, a river of central England, and next in importance to the Thames and Severn, rises in the moorlands of Staffordshire, and flows in a N.E. direction through the counties of Derby, Nottingham, and Lincoln, till it joins the Ouse to form the estuary of the Humber, after a course of 140 miles. The principal of the other rivers are the Tyne, Wear, Tees, Ouse, Humber, Mersey, Dee, Wye, Medway, and Avon.

Lakes.—England possesses few lakes, none of which are of great extent. They are chiefly in the counties of Westmoreland and Cumberland, and add greatly to the picturesque beauty of that district. Windermere, the largest of the English lakes, is about twelve miles in length by one in breadth. The chief of the others are Ulleswater, Derwentwater or Keswick Lake, and Whittleseamere.

Climate.—The climate is chiefly characterised by the absence of extremes in temperature, by humidity, and by variableness. The extremes of heat and cold are, on account of its insular position, much less than those of corresponding latitudes on the Continent. In the coldest season (January), the thermometer seldom falls much below the freezing-point; and in the warmest (June and July), it rarely rises above 80° Fahr. The mean annual temperature is about 49° Fahr. The prevailing winds for the greater part of the year are the S.W. and W., but in the months of April, May, and June, cold E. and N.E. winds are common. The mean annual fall of rain is about thirty-one inches; but in Cumberland it is as high as fifty-one, and in some parts of the E. coast as low as twenty inches. Most rain falls in summer and autumn.

Agriculture.—The principal crops raised in England and Wales are wheat, oats, barley, rye, beans, peas, turnips, potatoes, etc. We have no means of ascertaining the exact amount of land under the different kinds of crops, but the following is an estimate given by Mr. M'Culloch in the last edition of his Commercial Dictionary:

Crops.	Acres.	Produce.	Value.
		Qrs.	
Wheat	3,500,000	13,125,000	£28,125,000
Barley	1,500,000	6,750,000	8,678,572
Oats and Rye	1,500,000	6,750,000	5,785,715
Beans and Peas	700,000	2,625,000	3,375,000
Potatoes, Turnips, and Rape	2,500,000 2,000,000	.....	31,500,000
Clover	800,000	.....	.....
Fallow	50,000	.....	780,000
Hops	150,000	.....	2,250,000
Gardens			
Total	12,700,000		£80,494,287

The total annual agricultural produce, including horses, cattle, dairy produce, etc., of England and Wales may be estimated at £150,000,000, the number of cattle at 4,500,000, sheep at 27,000,000, and horses at 900,000. The total number of "persons possessing or working the land and engaged in growing grain, fruits, grasses, animals, and other products, and persons engaged about animals," in 1861 was 2,010,454, of which 1,631,652 were males, and 378,802 females.

Minerals.—To her mineral wealth, more than to anything else, is England indebted for the high position she now occupies. Mining operations are carried on to a greater or less extent in thirty-three counties of England and Wales; and the chief productions are coal, iron, copper, tin, lead, silver, manganese, zinc, gold, antimony, nickel, and cobalt. There are 2555 collieries in England and Wales; and the total produce of coal from these in 1861 was 72,431,144 tons. The quantity of iron ore raised in that year was estimated at 5,239,386 tons; of copper ore, found chiefly in Cornwall and Devonshire, at 196,798 tons. There are 148 tin mines, of which 144 are in Cornwall, and the rest in Devonshire, producing (1861) 10,963 tons of ore. The total quantity of lead ore produced was 83,722 tons; of silver, 479,696 oz. Gold has been found, but only in small quantities, in various parts of England, amounting in 1861 to 2,784 oz. The amount of zinc ores obtained was 4,415 tons. The estimated value of the mineral productions of the United Kingdom in 1861 was £34,602,853; and the number of persons employed in the mines in England and Wales was 330,352.

Manufactures.—The manufactures of England are of vast extent and importance. The chief is that of cotton, which, in 1861, afforded employment to 407,598 persons. It may almost be said to have entirely taken its rise within the last hundred years. It received its first great stimulus from the invention of the spinning jenny in 1767; and the subsequent inventions of Arkwright, Watt, Cartwright, Crompton, and others, have carried it to an extraordinary state of improvement. In 1861 the number of cotton factories was 2,715, with 28,352,125 spindles, and 368,125 operatives. Since that time this manufacture has suffered severely, in consequence of a scarcity of the raw material arising from the present unfortunate war in America. The imports of raw cotton, which in 1861 amounted to 11,223,078 cwt., and in 1860 to 12,419,096, fell in 1862 to 4,678,333, and in 1863 to 5,978,420. This occasioned much distress in the manufacturing districts, but of late the trade has much revived in consequence of supplies from other districts, particularly Egypt and British India. The chief seat of the cotton manufacture is Lancashire. The woollen manufacture was established in England at a very early period. It received its first great impulse at the hands of Edward III., who induced a number of Flemish manufacturers to settle in England; but even to the beginning of the present century this trade has had to struggle under a number of very oppressive restrictions, and so it has not attained to that importance that it otherwise might have done. In 1820, under the high duty, only 7,691,000 lbs. wool were imported, while in 1863 the quantity imported was 177,377,664 lbs. The quantity of wool produced at home may be estimated at about 120,000,000 lbs. The chief seats of the woollen manufacture are in the West Riding of Yorkshire, especially in and around Leeds, Wakefield, Huddersfield, Halifax, Bradford, and Dewsbury. The manufacture of woollen and worsted stockings is chiefly carried on in Leicestershire. The annual value of the woollen manufacture is estimated at £30,000,000. In 1861 it afforded employment to 238,814 persons in England and Wales. The manufacture of linen is pursued chiefly in the counties of York, Lancaster, Salop, Durham, and Dorset. It was established here at an early period, but its recent progress has not been so great as might have been expected, owing no doubt partly to the use of cotton stuffs having become so general. The number of persons employed in this manufacture in England and Wales, in 1861, was 20,305. The silk manufacture appears to have existed in England as early as the fourteenth century; and in the reign of Queen Elizabeth the number engaged in the production of silk goods was estimated at 40,000. According to the last census this manufacture was employing 117,989 persons. Its chief seats are the metropolitan districts of Spitalfields, Manchester, Macclesfield, and Coventry. The value of the silks annually produced is estimated at about £12,000,000. The manufacture of hardware goods is another very important branch of industry in England. The quantity of pig iron made in 1861 was 2,762,390 tons. The annual value of the hardware products of England and Wales is estimated at £25,000,000. Staffordshire, Shropshire, Birmingham, and Sheffield, are the chief seats of the iron manufacture in England. The leather manufactures are extensive, and are estimated to amount in value to £15,000,000 annually; the

earthenwares to £2,500,000; glass, £3,000,000; and paper, £2,000,000. Ship-building is very extensively carried on; and breweries, distilleries, sugar refineries, etc., are established in all the larger commercial towns. The fisheries constitute an important branch of industry on many parts of the coast, but they have never risen to be a principal source of national wealth, nor, indeed, have they been developed to the extent that they might be. The herring, cod, mackerel, sole, flounder, and salmon, are the most important of the fisheries. The oyster and pilchard fisheries are important in some parts. In 1860 the total annual value of real property assessed to the property and income tax was £112,082,749, of which £42,940,209 was lands, £48,779,076 tenements, £54,738 tithes, 212,014 manors, £225,639 fines, £366,222 quarries, £3,658,517 mines, £1,134,012 iron-works, £16,840 fisheries, £672,312 canals, £10,732,838 railways, £918,702 gas-works, £2,271,630 other property.

Internal Communication.—No other country in the world is, in proportion to its size, so well provided with means of internal communication as England. Independent of its navigable rivers, of which there are about 50, it has 2300 miles of canals, 8,176 miles of railway in operation, 24,000 miles of turnpike-roads and paved streets, and about 100,000 miles of cross-roads. The construction of canals in England originated during the latter half of the last century. The Duke of Bridgewater's canal, from the head of the Mersey to Manchester, was opened in 1766, and was the first to arouse the British nation to appreciate fully the advantages of canal navigation. It was followed in 1777 by the Grand Trunk Canal, which, by uniting the Trent and the Mersey, connected Liverpool with Hull and the Eastern with the Western Seas. Other canals followed, till all the great cities, seaports, and manufacturing towns were united together. The principal are the Leeds and Liverpool, 129 miles in length; the Grand Junction and the Grand Trunk, each 93 miles; the Oxford, 90; and the Lancaster, 75 miles in length. Canal navigation, however, has been in a great measure superseded since the introduction of railways. The first railway of any importance in England was the Liverpool and Manchester, opened in 1830; and since that time they have spread over all parts of the country. At 31st December 1862 there were 8176 miles of railway open in England and Wales; the total number of passengers conveyed in that year was 152,437,927, and the total receipts from all sources of traffic were £24,529,062.

Commerce.—In 1855 the total imports of the United Kingdom amounted in real value to £143,660,335, and in 1863 to £248,980,942; the exports in 1855 to £116,701,041, and in 1863 to £195,974,773, of which £146,489,768 was produce of the United Kingdom, and £49,485,005 foreign and colonial produce. The following are the values of the principal articles of British and Irish produce exported in 1863:—Apparel, haberdashery, and millinery, £7,169,975; beer and ale, £1,776,763; brass and copper manufactures, £4,233,075; coals, cinders, and culm, £3,708,221; cotton manufactures of all kinds, £39,424,010; cotton yarn, £8,019,954; earthenware, £1,334,275; hardwares and cutlery, £3,826,784; leather and leather wares, £2,319,763; linen yarn and manufactures, £9,045,698; machinery of all kinds, £4,365,023; iron and steel, wrought and unwrought, £13,111,477; silk, thrown and twist, and manufactures, £2,229,592; tin plates and tin, £4,891,424; woollen manufactures of all kinds, £5,518,842; woollen yarn, £5,065,432. The number of sailing vessels registered as belonging to the various ports of the United Kingdom at 31st December 1863 was 26,339—tonnage, 4,733,212; steam vessels, 2,298—tonnage, 594,861. The total tonnage of vessels that entered the various ports of the United Kingdom in 1863 was—British, 8,430,146; foreign, 4,825,917: that left these ports—British, 8,589,246; foreign, 4,893,424.

Revenue.—The total revenue of the United Kingdom for 1863 amounted to £70,208,964, of which the principal items were—Customs, £23,232,000; excise, £18,207,000; stamps, £9,327,000; taxes, £3,218,000; property-tax, £9,084,000; post-office, 3,810,000. The expenditure for that year was £67,056,286; and the national debt, £790,565,224, of which £13,136,000 was unfunded debt.

Government.—The Government is what is termed *mixed*, being partly monarchical, partly aristocratical, and partly democratical. The legislative power is vested in the Sovereign and in the two Houses of Parliament. The monarchy is hereditary, under certain limitations. The House of Peers at present comprises 3 princes of the Blood Royal; 20 dukes; 21 marquesses; 131 earls; 28 viscounts; 224 barons; 26 English archbishops and bishops, and 4 Irish representative archbishops and bishops—in all, 457 members, of whom 16 are Scotch and 28 Irish representative peers. The House of Commons is composed of 145 English county members, 320 city and borough members, and 4 university members; 15 Welsh county members, and 14 city and borough members; 30 Scotch county members, and 23 city and borough members; and 64 Irish county members, 39 city and borough members, and 2 university members—in all, 656 members. The total number of electors in Great Britain in 1861 was 1,078,128, of whom 483,538 were English county, 454,822 city and borough, including 7,735 university electors; 35,810 Welsh county, and 12,741 city and borough electors; 35,769 Scotch county, and 55,448 city and borough electors.

Religion.—The Sovereign is head and supreme governor of the Established Church in England, and has the nomination of the bishops and archbishops. There are 2 archbishops and 26 bishops. Deans and prebendaries are attached to cathedrals, and assist the bishop in the duties of his office. The dignitary next to the bishop is the archdeacon, of whom there are 71 in England and Wales, including the Channel Islands. The inferior clergy are rectors, who are the recipients of all the parochial tithes; and vicars and curates, who are only delegates, and receive but a portion of the tithes. The total number of benefices is about 12,500, of which nearly five-sixths are in the province of Canterbury, and the remainder in that of York. They vary in value from £10 or under, to upwards of £2000 annually, a large proportion of them being from £50 to £100. The Ecclesiastical Commissioners have, since 1840, done much for the augmentation of poor benefices. To the end of 1863 the sums so appropriated amounted to about £5,500,000, of which about £1,000,000 had been derived from private benefactors, and the remainder from the re-distribution and improvement of ecclesiastical property. The income of the Church is derived from lands, tithes, church-rates, pew-rents, Easter-offerings, and surplice-fees, and may be estimated to be considerably above £5,500,000. In 1851 there were 14,077 churches, with accommodation for 5,317,915 persons, besides 24,390 places of worship belonging to dissenters—viz., 3,244 to Independents, 2,789 to various kinds of Baptists, 11,944 to various kinds of Methodists, 570 to Roman Catholics, 32 to Catholic and Apostolic Church, 371 to the Society of Friends, 160 to Scottish Presbyterians, 229 to Unitarians, 32 to Moravians, 6 to Sandemanians, 50 to New Church, 132 to Brethren, 544 to isolated congregations, 6 to Lutherans, 3 to French Protestants, 3 to Greek Church, 222 to Latter-Day Saints, and 53 to Jews. There has been no subsequent religious census; but in 1861 there were 19,195 clergymen, 7,840 Protestant ministers, 1,216 Roman Catholic priests, and 103 priests of other bodies, besides 1,916 missionaries, itinerant preachers, and scripture readers.

Education.—In 1851 there were in England and Wales 46,042 day-schools attended by 2,144,378 scholars (1,139,324 males, and 969,268 females); 23,514 Sunday-schools, with 2,407,642 scholars; and 1545 evening schools for adults, with 39,783 scholars. Of the day-schools, 15,518, with 1,422,982 scholars, were public, and 30,524, with 721,396 scholars, were private day-schools. The census of 1861 gives, under the head of "scholars," 3,150,048, of which 1,552,738 were males, and 1,597,310 females. The total number of primary schools in England and Wales inspected in 1863 (including the Isle of Man and Roman Catholic schools for Great Britain) was 6,227, with accommodation for 1,315,988, and having an average attendance of 846,805 children.

Army and Navy.—The number of officers, non-commissioned officers, and rank-and-file of Her Majesty's land forces voted for the effective service of the United Kingdom (exclusive of the troops in the East Indies, 72,676, in number) for the year ending 31st March 1864 was 148,242. The estimated charge was—for the effective service, £12,932,399; the non-effective, £2,127,838; in all, £15,060,237. The number of officers, seamen, boys, and marines, voted for the service of Her Majesty's navy for the year 1864 was 76,000. The estimated charge was £10,736,032. The navy numbered, on 1st January 1864, 975 ships of all classes, including "non-effective sailing ships." Of these, 72 were ships of the line, mounting from 74 to 131 guns each; 39 of from 50 to 72 guns; 69 frigates of from 24 to 46 guns each; 30 screw corvettes, each mounting 21 guns; and upwards of 600 vessels of all classes mounting less than 20 guns; besides 185 gun-boats, each mounting 2 heavy Armstrong guns, and of 60 horse-power.

Divisions and Population.—England and Wales are divided into shires or counties, most of which are subdivided into hundreds and all into parishes, which are both ecclesiastical and civil divisions. Yorkshire is divided into three equal parts called Ridings, which are subdivided into wapentakes. The counties of Cumberland, Westmoreland, Northumberland, and Durham are divided into wards, Kent into lathes, and Sussex into rapes. The population of England and Wales during several periods was as follows:—(1700) 6,045,008; (1750) 6,517,035; (1801) 8,872,980; (1811) 10,150,615; (1821) 12,000,236; (1831) 13,896,797; (1841) 15,914,148; (1851) 17,927,614; (1861) 20,066,224.

Counties.	Area in Statute Acres.	Population. 1831.	1841.	1851.	1861.	Annual Value of Real Property. 1860.	Inhabited Houses. 1861.	County Towns.

The populations of the principal towns in 1861 were—London, 2,803,989; Manchester, 460,428; Liverpool, 443,938; Birmingham, 296,076; Leeds, 207,165; Bristol, 154,093; Sheffield, 185,172; Bradford, 106,218; Plymouth, 113,039; Portsmouth, 94,799; Newcastle-upon-Tyne, 109,108; Hull, 97,661.

SCOTLAND.

This division of the United Kingdom comprises the northern and smaller portion of the island of Great Britain. Its mainland portion extends from lat. 54° 38′ to 58° 41′ N., and from long. 1° 45′ to 6° 14′ W., being 275 miles in length from N. to S., and varying in breadth from about 30 to 175 miles. On the N. coast are the two large groups of the Orkney and Shetland Islands, extending northward to lat. 60° 50′ N.; and on the W. the Hebrides or Western Isles,

extending westward to long. 8° 32′ W. The whole coast is so much penetrated by arms of the sea that there is actually no place throughout its whole extent which is more than 40 miles from the shore. The coast line is estimated at at least 2500 miles in length. The total area of Scotland (including the islands) is 31,324 square miles, or 20,047,462 statute acres.

Surface.—The surface of the country is distinguished for variety, and, compared with England, is, generally speaking, rugged and mountainous. With the exception of a few rich alluvial tracts, there are no extensive plains in Scotland; its surface, even where least mountainous, being generally varied with hill and dale. It is naturally divided into Highlands and Lowlands. The former divison comprehends, besides the Hebrides and the Orkney and Shetland Islands, the counties of Argyle, Inverness, Nairn, Ross, Cromarty, Sutherland, and Caithness, with parts of Dumbarton, Stirling, Perth, Forfar, Kincardine, Aberdeen, Banff, and Moray or Elgin. The Highlands are again divided into two unequal parts by the deep and narrow valley through which the Caledonian Canal has been constructed. The northern division of the Highlands is decidedly the more barren and unproductive of the two, though the other division contains the highest mountains. In the eastern parts of Ross and Cromarty there are level tracts of considerable fertility. The Lowland division of the country, though comparatively flat, comprises also a large extent of mountainous districts, but the mountains are not so lofty, nor so bleak and rugged as in the Highlands.

Mountains.—The principal mountain-chain of Scotland is that of the Grampians, which commences on the S. side of Loch Etive, in Argyleshire, and terminates between Stonehaven and the mouth of the Dee, on the E. coast. Ben Nevis, the highest mountain in Great Britain, being 4406 feet above the mean level of the sea, lies immediately east of Fort-William, and is separated from the chain of the Grampians by the Moor of Rannoch. The most elevated part of the chain lies near the head of the Dee, where Ben Macdhui, the second highest mountain in Scotland, rises to the height of 4295 feet, and the adjoining mountains of Cairngorum, Cairntoul, and Ben Avon, are respectively 4090, 4245, and 3967 feet high. South of the Grampians, and running parallel to them, is a chain of hills divided into three distinct portions by the valleys of the Tay and Forth, termed the Sidlaw, Ochil, and Campsie Hills. The low country between them and the Grampians is called the Valley of Strathmore. The Cheviot Hills, situated partly in England and partly in Scotland, separate Northumberland and Roxburghshire, stretch through the latter county in a westerly direction, keeping to the N. of Liddesdale, then bend N.W. towards the junction of the counties of Roxburgh, Selkirk, and Dumfries, and unite with the Lowther Hills. The highest mountain in the Lowlands of Scotland is Broad Law, in the south of Peebleshire, 2761 feet above the level of the sea. The valleys and level tracts, though of small extent as compared with England, are yet most of them extremely fertile and well cultivated. The principal of these are the Carse of Stirling and Falkirk, on both sides of the Forth; that of Strathearn and Gowrie, on the Tay; the Merse of Berwickshire, along the Tweed; the Valley of Strathmore and the Howe of the Mearns; Teviotdale, along the Teviot; Tynedale, along the Tyne in East Lothian; and the Howe of Fife.

Rivers.—The principal rivers of Scotland are the Tweed, Forth, Tay, Spey, and Clyde. The Tweed rises at Tweedshaws, in the S. of Peebleshire, and flows first in a northerly direction to Peebles, and then eastward past Melrose, Kelso, and Coldstream, to its mouth at Berwick, having a course of about 100 miles. The Forth rises on the N.E. side of Ben Lomond, in the county of Stirling, and flows E. by Aberfoyle, Stirling, and Alloa, and afterwards expands into an arm of the sea called the Firth of Forth. Including its windings, which are numerous, its course is estimated at 160 miles. The Tay which is said to discharge a greater quantity of water than any other river in Britain, rises in Breadalbane, on the confines of Argyleshire, flows through Loch Tay, and after passing Aberfeldy, Dunkeld, and Perth, expands into an estuary called the Firth of Tay, and falls into the German Ocean at Button Ness, after a course of about 130 miles. The Spey the most rapid, and at the same time one of the largest of the Scottish rivers, rises in Loch Spey, about six miles from the head of Loch Lochy, and has a N.E. direction through Badenoch and Strathspey to Fochabers, below which it falls into the Moray Firth, after a winding course of about 110 miles. The Clyde, though not the largest, is, in a commercial point of view, the most important of Scottish rivers. It rises on the borders of Dumfriesshire, near the sources of the Annan and Tweed, flows first N. and then N.W., passing Lanark, Hamilton, and Glasgow, and expanding into the Firth of Clyde about 8 miles below the last-named town. Its length to Glasgow is about 75 miles. The chief lakes of Scotland are—Loch Lomond, lying between Dumbartonshire and Stirlingshire; Loch Ness, in Invernessshire; Loch Awe, in Argyleshire; Lochs Tay, Rannoch, and Erich, in Perthshire, etc.

Minerals.—The most important of the mineral productions are coal and iron. The great coal-fields of Scotland extend, with little interruption, through the middle portion of the country, from the eastern to the western coast, the most valuable part being situated on the N. and S. sides of the Forth, with an average breadth of 12 miles on each side; and on the N. and S. sides of the Clyde, ranging through Renfrewshire, Lanarkshire, and the northern part of Ayrshire. In 1861 there were 413 collieries in operation, the produce of which during that year amounted to 11,081,000 tons. Iron is of frequent occurrence in the coal districts, especially in Lanarkshire. In 1835 there were only about 75,000 tons of pig-iron produced, whereas in 1861 the quantity produced was 950,000 tons. There are lead mines at Leadhills in Lanarkshire, Wanlockhead in Dumfriesshire, and other places, which produced (1861) 1228 tons of lead and 4133 oz. of silver. Gold has also been found at Leadhills and other parts of Scotland. Copper is wrought to some extent; and cobalt, antimony, manganese, etc., are met with in small quantities. Slate, limestone, sandstone, and granite are common.

Climate.—The climate is more rigorous than that of England; but owing to the numerous firths and deep bays by which it is penetrated, neither the heat of summer nor the cold of winter is so intense as might be expected. The mean annual temperature of the year averages about 47° Fahr.; the mean of winter being about 38°, of summer about 56°. The quantity of rain which falls on the east coast varies from 22 to 26 inches, while on the west coast and in the Hebrides it ranges from 30 to 44 inches.

Agriculture has been making rapid progress in Scotland since the middle of the last century, and in some parts it is such as to be unrivalled in any other country. In particular, during the last 20 years, all sorts of improvements have been prosecuted with extraordinary spirit and success. Since 1846 draining has been extensively carried on, and by this means the soil has been much improved. The principal crops are wheat, barley, oats, etc. The total number of acres under cultivation in 1857 was 3,556,572; of which 223,152 were in wheat; 938,613 in oats; 198,387 barley; 5989 rye; 21,607 bere; 39,186 beans; 3687 pease; 18,418 vetches or tares; 476,691 turnips; 139,819 potatoes; 18,582 summer fallow; and 1,459,805 grass and hay under rotation. This is of farms of and above £10 of rent, and, in a few counties only, of and above £20. The smaller holdings not included in the above account are estimated to give an additional acreage of about 220,000 acres. The estimated gross produce of the principal crops in 1857 is as follows:—wheat, 6,154,986 bushels; barley, 6,564,429; oats, 32,750,763; bere, 671,778; beans and peas, 1,037,760; turnips, 6,690,109 tons; and potatoes, 430,468 tons. The stock comprised 185,409 horses; 974,437 cattle; 5,683,168 sheep.

The *Fisheries* are extensive and valuable, including salmon, herring, ling, cod, etc. In 1861, the quantity of herrings caught was 723,486 barrels, of which 650,716 were cured. The cod and ling fisheries produced 131,764 cwts., of which 82,203 cwts. were cured. The total number of boats employed in the fisheries was 12,370 with a tonnage of 88,795, and employing 40,271 fishermen and boys, besides 48,398 others employed in the fisheries.

Manufactures.—What has been said of the manufacturing industry of England applies also in a great measure to Scotland; and in most cases the statistics of the manufactures of the latter have been included in the account of those of the former. The cotton manufacture, which centres chiefly in Glasgow and Paisley, is of comparatively recent introduction, the first steam-engine for a cotton factory having been constructed in 1792. In 1861 there were 163 factories, 1,915,398 spindles, and 30,110 power-looms, employing in all 41,237 persons. Compared with that of England, the woollen manufacture in Scotland is inconsiderable; but it is actively prosecuted in Galashiels, Hawick, Paisley, Kilmarnock, and Aberdeen. In 1861 the various branches of this manufacture afforded employment to 28,318 persons. The linen manufacture has its chief seat in Dundee, but it is also extensively carried on in Forfar, Arbroath, Montrose, and Aberdeen, and the finer kinds in Dunfermline. In 1861 it employed 44,646 persons. The silk manufactures are insignificant. The manufacture of machinery and hardwares, ship-building, coach-building, paper-making, whisky-distilling, and glass, soap, and candle manufactures, are among the chief of the other branches of industry pursued.

Internal Communication.—The most important of the Scottish canals are—The Great Canal, uniting the Firths of Forth and Clyde, 38 miles in length; the Union Canal, 31 miles in length, extending from the former at Falkirk to Edinburgh; the Crinan Canal, across the Mull of Cantyre; the Caledonian Canal, 59 miles in length, which, by uniting a number of lakes, stretches quite across the island, through the centre of the Highlands. The turnpike roads, of which there are in all about 3700 miles, are considered superior even to those of England. In 1862 there were 1777 miles of railway in operation in Scotland, the total number of passengers conveyed being 17,610,927.

Commerce.—The vessels registered as belonging to the various ports in Scotland at 31st December 1862 were—Sailing-vessels, 3100, with 561,817 tons burden; steam-vessels, 337, with 80,520 tons burden—total, 3437; tonnage, 642,337. The numbers that entered and cleared at the various ports during that year (sailing and steam, including repeated voyages) were, in the coasting trade—inwards 21,084, tonnage 2,406,423; outwards 23,115, tonnage 2,501,360: in the colonial trade—inwards 523, tonnage 231,140; outwards 680, tonnage 324,902: in the foreign trade—inwards 5288, tonnage 850,042; outwards 6142, tonnage 956,680.

Population.—The population of Scotland, at decennial periods since the beginning of the present century, was—(1801) 1,608,420; (1811) 1,805,864; (1821) 2,091,521; (1831) 2,364,386; (1841) 2,620,184; (1851) 2,888,742; (1861) 3,062,294, as follows:—

Counties.	Area in Statute Acres.	Acreage under Crops, 1857.	Population.				Annual Value of Real Property, 1860.
			1831.	1841.	1851.	1861.

* In the Counties marked with an asterisk, there are no returns from occupants whose rent is below £20; in the other Counties all at and above £10 of rent are included.

The principal towns, with their populations in 1861, are—Edinburgh, 168,121; Glasgow, 394,864; Dundee, 90,417; Aberdeen, 73,805; Paisley, 47,406; Greenock, 42,098; Leith, 33,628.

Religion.—In 1851 there were in all 3395 places of worship, with 1,884,805 sittings. Of these, 1183 places of worship, with 767,088 sittings, belonged to the

Established Church; 889, with 495,335 sittings, to the Free Church; 465, with 288,100 sittings, to the United Presbyterians; 192, with 76,342 sittings, to Independents; and 134, with 40,022 sittings, to Episcopalians. The census of 1861 gives 1486 Established Church ministers; 973 Free Church ministers; 588 United Presbyterian; 185 Roman Catholic priests; 198 Episcopalian ministers; and 396 ministers of other denominations.

Education.—The total number of day-schools in Scotland in 1851 was 5242, having 368,577 scholars, of whom 205,348 were males and 163,169 females. Of these, 3349 schools, having 280,045 scholars, were public; and 1893, with 88,472 scholars, private day-schools. The total number of Sunday-schools was 3803, with 292,549 scholars. Of these, 1095, with 76,233 scholars, belonged to the Established Church; 1243, with 91,328 scholars, to the Free Church; 558, with 54,324 scholars, to the United Presbyterians; and 176, with 12,593, to the Independents. The census of 1861 gives under the head of "scholars" 467,056, of whom 241,803 were males, and 225,253 females. The number of primary schools in Scotland inspected in 1863 (exclusive of Roman Catholic schools) was 1512, with accommodation for 196,794 children, the average attendance being 162,120.

IRELAND.

Ireland lies to the W. of Great Britain, from which it is separated by St. George's Channel, 47 miles across where narrowest; the Irish Sea, 138; and the North Channel, 13 miles across. It extends from lat. 51° 26′ to 55° 21′ N., and from long. 5° 20′ to 10° 26′ W.; its greatest and least breadth on parallels of latitude being 147 and 111 miles, and it greatest length on a meridian 225 miles. Area, 31,754 square miles, or 20,322,641 acres, of which it is estimated that 2,830,000 acres are turf bog. The N., W., and S. coasts are indented with numerous deep and safe bays; but the E. side presents few harbours suitable for large vessels. The islands on the coast are numerous, amounting to 196, but are all small.

Surface.—The greater part of the surface is plain, not strictly level, but mostly interspersed with low hills. The principal mountains are the Mourne Mountains in Down County. The mountains surrounding Clew Bay, in Mayo County, Macgillicuddy's Reeks, in Kerry County, and the Wicklow Mountains, are all to be found near the sea-coast, forming, as it were, a broad fringe round the island, and rarely extending more than 20 miles inland. The interior appears as a large plain traversed only by a few low ranges of hills. The highest summit in Ireland is Carran Tual, in Magillicuddy's Reeks, which rises to the height of 3414 feet above the level of the sea. The rivers are numerous. The principal is the Shannon, 159 miles long, from Lough Allen to Limerick, where it expands into an estuary 45 miles in length, opening into the Atlantic. It is navigable through nearly the whole of its course. The Suir, Barrow, Nore, Blackwater, Slaney, Boyne, Foyle, Erne, Lee, Bandon, Bann, and Moy, are all navigable to a greater or less extent. The lakes or loughs are numerous; the largest, Lough Neagh, in Ulster, covers an area of 98,255 acres. The other remarkable lakes are Loughs Erne, Corrib, Mask, Conn, and the Lakes of Killarney. The aggregate surface of the lakes is estimated at 336 square miles.

Climate.—The climate is mild and temperate, but moist, and is more suited for pasture than for agriculture. Plants that require artificial heat in England flourish here in the open air. The mean winter temperature is 30.9°; mean summer, 60.5°; mean annual, 49.6° Fahr. Average annual fall of rain on the E. coast, 29, and on the W. coast, 47 inches.

Minerals.—The principal minerals are coal, iron, copper, lead, and gold. The coal-fields are seven in number—the 1st occupying large portions of Kilkenny and Queen's Counties, with a small portion of Carlow; 2d, in Tipperary, bordering on that of Kilkenny; 3d, spread over large portions of Clare, Limerick, Cork, and Kerry Counties, the most extensive development of the coal strata in the British empire; 4th, at Coal Island, near Dungannon; 5th, in the northern extremity of Antrim County; 6th, in Monaghan; and, 7th, the Connaught coal-field, extending over portions of Roscommon, Sligo, Leitrim, and Cavan Counties. The first three of these yield only stone-coal, or anthracite; the remainder, bituminous or flaming coal. The total quantity of coal raised in Ireland in 1861 was 123,070 tons. Iron ore is found in all the localities of coal, and was largely manufactured while timber for fuel was abundant, but latterly the efforts to carry on the manufacture have not been profitable. There are copper mines in the counties of Cork, Tipperary, Waterford, and Wicklow. The quantity of Irish copper ore sold at Swansea in 1862 was 13,729 tons, of the value of £125,401. Lead is much more extensively diffused than copper, and is principally found in the counties of Wicklow, Tipperary, Kerry, Down, Clare, and Donegal. In 1862, 1763 tons of lead and 12,741 oz. of silver were produced. About 80,000 tons of sulphur ores are annually exported from the Arklow district. Salt rock has latterly been worked near Carrickfergus, and the quality is said to be superior to that of Cheshire. The present annual produce is about 20,000 tons. Gold is found in small quantities in Wicklow. Manganese, antimony, zinc, nickle, and tin, are among the principal of the other minerals. Limestone, granite, mica-slate, clay-slate, old red sandstone, yellow sandstone, and trap, are the principal geological formations.

Agriculture.—Agriculture in Ireland is in a very neglected state, owing, no doubt, partly to the minute subdivision of the land. In 1862 there were 609,726 holdings, one-half of which did not exceed fifteen acres; 43,630 did not exceed one acre; and 84,559 were from one to five acres. The total acreage under the various kinds of crop in each county in 1863 are given in the subsequent table. In 1862 there were 5,753,610 acres under crops; 9,702,232 grass; 41,004 fallow; 317,345 woods and plantations; and 4,505,733 bog and waste. The acreage under the principal crops was—Wheat 356,321; oats 1,977,528; barley 192,302; bere 2910; rye 9218; beans and peas 15,202; potatoes 1,018,112; turnips 376,715; mangel 23,114; flax 150,070; rape 1525; hay 1,552,924. The principal products were—Oats 7,283,400 quarters; wheat 683,048; barley 661,833; potatoes 2,148,402 tons; turnips 3,792,682; flax 24,258; and rape 92,804. In 1863 the live stock included 579,179 horses, 3,138,275 cattle, 3,303,931 sheep, and 1,064,802 pigs; the total value of which was calculated at £3,138,275. The seas around Ireland swarm with fish, but the fisheries have never been either largely or successfully carried on. In 1862, 11,375 vessels and boats, and 48,601 men and boys, were engaged in the sea-coast fisheries. There are about 120 salmon rivers in Ireland.

Manufactures.—The manufactures are chiefly woollen, linen, and cotton stuffs, and some of these are very extensive. The cotton manufacture is now confined to six counties, the chief of which are Waterford and Antrim. The total number of factories in 1862 was 9, with 119,944 spindles and 1757 power-looms, and affording employment to 2734 persons. The woollen manufacture has its principal seat in Dublin County; and in 1862 there were 39 factories, with 18,574 spindles and 123 power-looms, affording employment to 862 persons. There are 3 worsted factories with 4,700 spindles, and affording employment to 175 persons. The linen manufacture has of late years greatly revived in consequence of the application of machinery to the spinning of yarn, and the introduction of the power-loom in weaving. The number of factories in 1862 was 100, with 592,981 spindles, and 4666 power-looms, the number of persons employed being 33,525. The annual value of the linen products is estimated at £7,000,000. The silk manufacture, since its introduction by French emigrants in the beginning of the last century, has been confined to Dublin. About 300,000 persons, chiefly females, are employed in the N. of Ireland in the working of patterns on muslin with the needle. Belfast is the centre of this manufacture, and the gross value of the manufactured goods amounts to about £1,400,000. The distillation of spirits is extensively carried on, the quantity produced in 1862 being 4,653,773 gallons.

Commerce, etc.—The principal trade of Ireland is in the exportation of its agricultural products; and by much the greater part of it is carried on with Liverpool, Bristol, and Glasgow. The colonial and foreign trade is comparatively inconsiderable. The total amount of shipping registered as belonging to the various ports of Ireland at 31st December 1862 was—Sailing vessels 2153, tonnage 200,218; steam-vessels 185, tonnage 48,286. The total number of vessels that entered and left the different ports during that year was—Coastwise, sailing vessels inwards 20,122, tonnage 1,551,416; outwards 6691, tonnage 420,806; steam-vessels inwards 6818, tonnage 2,034,903; outwards 7206, tonnage 2,128,162: colonial trade, inwards 294 vessels, tonnage 110,026; outwards 279, tonnage 114,348: foreign trade, inwards 1767 vessels, tonnage 508,605; outwards 526, tonnage 174,555. The exports are chiefly cattle, sheep, swine, salted provisions, grain, flour, butter, eggs, and linen; imports—coal and culm, fish, salt, woollen and cotton yarn and stuffs, and colonial produce. We have no means of estimating the amount of the trade between Great Britain and Ireland; but in the three years ending 1861 it included 979,984 cattle, 1,256,490 sheep, 1,089,374 swine, 376,453 quarters of wheat and wheat flour, 4,544,961 quarters of oats and oatmeal, and 3,647,198 gallons of Irish spirits sent from Ireland. The total length of railway open in the end of 1862 was 1598 miles, and the total number of passengers conveyed during that year was 10,438,873. The principal of the canals are the Grand and the Royal, the former with its branches having a length of 160, and the latter of 92 miles. The executive government is vested in a Lord-Lieutenant, who must be a peer, assisted by a privy council (indefinite in number) appointed by the Crown, and by a chief secretary, a member of the House of Commons. In the absence of the Lord-Lieutenant, his place is supplied by lords-justices, who are usually the Primate or Archbishop of Dublin, the Lord Chancellor, and the commander of the forces. The total revenue paid into the exchequer from Ireland in 1862 was £6,675,157, of which £2,274,000 were derived from customs duties, £2,758,000 from excise, £573,040 from stamps, £672,780 from property and income tax. The expenditure for the same period was £6,736,281.

Population.—The population of Ireland in 1811 was 5,937,856; 1821, 6,801,827; 1831, 7,767,401; 1841, 8,175,124; 1851, 6,551,970; 1861, 5,798,967. The population in 1841, 1851, and 1861, and the acreage under the principal agricultural crops in the various counties in 1863, were as follows:—

	Counties.	Population. 1841.	1851.	1861.	Area in Statute Acres.	Acreage under Crops, 1863.	Wheat.	Oats.	Potatoes.
Leinster.	Carlow	86,228	68,059	57,137	221,293	82,323	7,360	23,561	12,844

	Tyrone	312,956	255,734	238,500	778,944	275,150	1,614	136,286	48,579
Galway.	Galway	440,198	321,831	271,478	1,499,210	232,497	9,144	78,680	57,171
	Leitrim	155,297	111,841	104,744	376,213	84,410	51	23,079	22,544
	Mayo	388,887	274,612	254,796	1,321,281	191,399	2,515	82,300	63,805
	Roscommon	253,591	173,417	157,272	585,407	137,634	851	49,255	35,685
	Sligo	180,886	128,510	124,845	451,086	99,356	1,239	41,461	27,988
	Total	8,175,124	6,551,970	5,798,967	20,322,641	5,661,179	264,766	1,948,986	1,023,626

Besides those given in the table, there were 195,010 acres in barley, bere, rye, beans and peas, 351,360 in turnips, 102,791 in other green crops, 213,992 in flax, and 1,560,648 in meadow and clover.

The chief towns, with their populations in 1861, are—Dublin, 254,808; Belfast, 121,602; Cork, 80,121; Limerick, 44,476.

Religion.—Only about one-ninth of the people of Ireland belong to the Established Church—that of England, and about four-fifths of them are Roman Catholics. In 1861, of the entire population of 5,798,967, 693,357 were of the Established Church; 4,505,265 Roman Catholics; 523,291 Presbyterians; 76,661 Protestant dissenters; and 393 Jews. Since 1834, while the population of the country has decreased 27·1 per cent, the Established Church and the Presbyterian

have only decreased 18·7 per cent, while the Roman Catholics have decreased 30 per cent; and Protestant dissenters have increased 251·3 per cent. The Established Church has 2 archbishops and 10 bishops, and the church revenues in 1861 amounted to £580,419. The Roman Catholic hierarchy consists of 4 archbishops and 24 bishops. The number of priests in 1854 was 2291, of whom 1222 had been educated at Maynooth. In 1861 the number of Roman Catholic clergy was 3014. There are numerous monasteries and convents. The Presbyterian Church exists chiefly in the province of Ulster, and in 1856 comprised 510 congregations arranged under 37 presbyteries. The ministers are supported by voluntary contributions, the seat-rents, and the *Regium Donum*, or sum granted them annually by government, and amounting in 1863 to £39,746.

Education.—In 1834 the number of schools, according to the Report of the Commissioners of Public Instruction, was 9657, and the number of persons receiving instruction 633,946. In 1861, notwithstanding the decrease of the population, the number of schools was 10,580, and of scholars 481,240, of whom 127,173 were Protestants, and 339,645 Roman Catholics; of the former, 75,383 belonging to the Established Church, and 46,095 being Presbyterians.

FRANCE.

This extensive and important country of Western Europe is situated between lat. 42° 20′ and 51° 5′ N., and long. 4° 40′ W. and 8° 15′ E.; and is bounded on the N.E. by Belgium, the Grand Duchy of Luxembourg, Rhenish Prussia, and Rhenish Bavaria; E. by Baden, Switzerland, and Italy; S. by the Mediterranean and Spain; W. by the Atlantic Ocean; and N.W. by the English Channel. Its form is somewhat hexagonal, its greatest length from N.W. to S.E. being 680 miles, and its greatest breadth from S.W. to N.E. 620 miles; area, 210,939 square miles. France possesses about 1480 miles of sea-coast, of which 360 are on the Mediterranean, 560 on the Atlantic, and about the same number on the English Channel. The coasts on the English Channel are generally bordered by sandy downs. The W. coast is at first elevated, bold, and rocky, but as it proceeds S. it gradually declines, and from the mouth of the Gironde it presents an unbroken line of sandy downs interspersed with marshes.

Mountains.—The surface is for the most part level, with here and there low ranges of hills, except on the S. and E., where the mountain-ranges of the frontiers send forth offsets towards the interior. The loftiest summits of France belong to the Alps, chief of which is Monte Blanc, on the borders of the newly-acquired territory of Savoy, 15,744 feet high. The loftiest summits of the Pyrenees in France are Mont Perdu, 10,990, and the Peak of Midi, 9432. The chain next in importance is the Cevennes, separated from the Pyrenees by the valley through which the Canal-du-Midi runs, and extending first in a N.N.E., and afterwards in a N. direction to the Canal-du-Centre. The Cevennes take various names during their course, which is about 360 miles in length, and they have an average height of about 3000 feet, the culminating point, Mont Mezen, being 5795 feet high. They send off various branches, among which are the mountains of Auvergne, chiefly scattered over the departments of Puy-de-Dôme and Cantal, and which contain the Pic-de-Sancy, 6196, and the Plomb-de-Cantal, 6095 feet in height. The Côte-d'Or of Burgundy, a range of slight elevation, serves, with the heights of Langres, to connect the Cevennes with the Vosges between Lorraine and Alsace; the principal summit is the Ballon-d'Alsace, 4690 feet in height. Branches of the Vosges extend to the S.E. so as to unite with the Jura.

Rivers.—The principal rivers of France are the Loire, Rhône, Garonne, and Seine. The Loire rises in the department of Ardèche, and flows in a N.N.W. direction to Orleans, and afterwards westward to its mouth in the Bay of Biscay, having a course of about 560 miles. The Rhône rises in Switzerland, and after passing through the Lake of Geneva, enters France S. of the Jura range, forming most of the W. and the entire S. boundary of the department of Ain. After passing Lyons, its course is almost due S. to the Mediterranean, which it enters by various mouths. Its entire length is about 640 miles. Its principal affluent, the Saône, which it receives at Lyons, has a length of about 220 miles. The Garonne rises in the Spanish Pyrenees near Mont Maladetta, and flows first N. to Toulouse, and then pursues a N.W. course till it falls into the Bay of Biscay by means of the estuary of the Gironde. The Seine, which rises in the department of Côte-d'Or, has a winding course of about 450 miles, generally in a W. and N.W. direction, and falls into the English Channel by an estuary 7 miles wide. The principal of the other rivers are the Rhine, which for about 100 miles forms its E. frontier, the Moselle, Meuse, Scheldt, Somme, Charente, Dordogne, Adour, Aude, Herault.

Climate.—In a country of such extent the climate must necessarily differ considerably in different parts. It may, however, be divided into three regions—the northern, central, and southern. The first may be said to comprehend Flanders, Picardy, Normandy, Brittany, and in general all the territory lying north of a diagonal line extending from lat. 47° on the W. to lat. 49° on the E. frontier. It bears a great resemblance both in temperature and produce to the S. of England, the chief products being wheat, barley, oats, rye, hemp, flax, apples, pears, and other fruits. The central region may extend from the above-mentioned line to a similar one from lat. 45° on the W. to 47° on the E. frontier. Here wheat, barley, oats, and rye are still cultivated, but maize begins to appear, and vines become general. The southern region approaches in climate to Spain and Italy. Wheat, barley, oats, and rye are cultivated only on the high grounds; maize is general and the vine common, furnishing the principal export. In the N. the mean temperature is 50°, and the winters are frequently long and rigorous; in the centre, where the climate is more mild and steady than in either the N. or S., the mean temperature is about 58°; and in the S., where the summers are long and warm, and the sky almost always serene, the mean temperature is about 60°.

Before the Revolution of 1789 France was divided into 33 governments or provinces of very unequal extent, which were subdivided into generalities and sub-delegations. It is now divided into 89 departments or prefectures, named generally after their principal river, mountain, or some other natural feature. These departments are divided into arrondissements, cantons, and communes; each department being under the charge of a prefect, each arrondissement of a sub-prefect, and each commune of a maire.

Population.—The population of France in 1801 was 27,349,003; in 1806, 29,107,425; 1821, 30,461,875; 1831, 32,569,223; 1836, 33,540,910; 1841, 34,213,929; 1846, 35,400,486; 1851, 35,783,170; in 1856, 36,039,364; and in 1861, 37,472,732. The following table gives the area and population of the several provinces in 1851 and at 31st December 1861:—

Departments.	Area in English Square Miles.	Population.		Departments.	Area in English Square Miles.	Population.	
		1851.	1861.			1851.	1861.
Ain	2,240	372,939	369,767	Lot-et-Garonne	2,065	341,345	332,065

The chief towns, with their populations in 1861, were—Paris, 1,696,141; Lyons, 318,803; Marseilles, 260,910; Bordeaux, 162,750; Lille, 131,827; Nantes, 113,625; Rouen, 102,649; Toulouse, 113,229; St. Etienne, 92,250; Toulon, 84,987; Strasbourg, 82,014.

Internal Communication.—Besides its rivers, of which 5480 miles are navigable, France possesses an extensive system of canal navigation, there being upwards of 2931 miles of canals, by means of which most of the principal rivers are connected. The *Canal-du-Midi*, or the Languedoc Canal, commences at Toulouse, on the Garonne, and, with the Canal of Cette, extends to the Port of Cette, thus connecting the Atlantic with the Mediterranean. The *Canal-du-Centre* unites the Saône and the Loire in the upper part of the course of the latter. The Canal of St. Quentin joins the Scheldt and the Somme. The Canal of Briare and that of Orleans unite the Loire with the Loing, a tributary of the Seine. The Canal of Burgundy joins the Rhône and the Seine; that of Brittany connects Brest and Nantes. The roads of France are of three kinds—those maintained by the Central Government, and denominated *Royal* or *State Roads;* those kept up by the various departments, and known as *Departmental Roads;* and those which are supported by the communes, and termed *Communal Roads.* The state roads are commonly well made and in good condition, and usually about 42 feet in width. They are frequently planted on each side with rows of chestnut or other large trees, and a considerable portion of them are paved like a street. There are about 23,000 miles of such roads. The departmental roads, of which there are about 21,500 miles, are somewhat narrower than the state roads, but are also generally in good condition, being under the superintendence of a central departmental board; while the communal roads, being subject to no such control, are frequently in a very wretched condition. All the principal towns of France are connected by railway. Since 1850 the construction of railways has been very actively carried on, and in 1863 there were 6965 miles in operation.

Agriculture in France was, until very recently, in a very backward condition, and even now in many parts it is little in advance of what it was centuries ago. A recent return gives the total area of cultivated land at 132,570,440 acres, including 29,991,240 of woods and forests; 16,449,957 pastures; 14,262,543 fallow; 19,051,805 meadows, and 5,477,272 vineyards. The acreage under principal crops was wheat, 17,461,930; rye, 5,483,075; oats, 8,156,513; barley, 2,602,077; potatoes, 2,073,243; buckwheat, 1,772,820; maize, 1,504,993; meslin, 1,432,462; besides beans, peas, beetroot, hemp, flax, hops, etc. The value of the principal products were—wheat, £62,649,641; wine, £29,004,134; oats, £14,580,682; potatoes, £7,945,260; barley, £5,880,142; meslin, £4,318,123; maize, £3,039,941; buckwheat, £2,924,612. The live stock comprised 10,093,737 cattle; 33,281,592 sheep; 2,866,054 horses; 315,831 mules; 380,180 asses; 1,337,940 goats; and 5,246,401 swine.

Minerals.—The mining industry of France has made great progress of late years. Coal and iron, at present its chief mineral productions, are raised to a considerable extent, although not yet in quantities sufficient to supply the home demand. France as a coal-producing country ranks next to Great Britain, and occupies the first place among the iron-making countries of continental Europe. The coal-fields are estimated to occupy an area of 700,000 acres; and the quantity of coal raised in 1859 was of the value of £3,799,164. The number of mines was 292, and the number of persons employed at them was 56,035. The amount of coal raised in 1863 was 9,843,000 tons, being double the amount raised in 1853. In 1859 the iron mines, employing 18,000 persons, produced 3,479,050 tons of iron ore, of the value of £484,652. The quantity of cast-iron manufactured in 1863 was estimated at 1,161,600 tons, of the value of £5,752,000. The principal of the

other metallic products are copper, lead, silver, antimony, manganese, tin, and zinc, but none of these are of great importance.

Manufactures.—These comprise woollen, cotton, silk, and linen stuffs; iron and steel goods; cutlery; gloves; sugar, etc. The cotton manufacture in France has suffered greatly of late, in consequence of the want of the raw material; but on the other hand the loss has been in a considerable degree compensated by an increase in the two analogous branches of industry, silk and woollen. The value of the imports of cotton in 1863 was less by £3,720,000 than in 1861. In 1863 the value of the cotton imported was £7,088,000; of wool, £9,632,000; and of silk and waste, £12,404,000. In that year the value of tissues of cotton exported was £2,764,000; of wool, £11,332,000; and of silk, £15,032,000. The value of wrought-iron produced during 1863 is estimated at £7,692,720. In 1860 there were 334 beetroot sugar factories in operation, and the quantity of sugar produced was 2,985,962 cwts.

Commerce.—The trade of France is carried on chiefly with England, Belgium, Switzerland, Germany, Spain, Russia, Italy, the United States of America, and the French colonies. In 1863 the total value of the imports was £94,704,840; of the exports, £104,898,232. The trade between France and England has largely increased since the signing of the Commercial Treaty between the two countries, 23d January 1860. The imports from England to France had risen in value from £11,128,000 in 1859, to £21,028,000 in 1862; and the exports from France to England from £34,780,000 in 1859, to £45,808,000 in 1862. The number of vessels that entered in 1863 were—French, 12,038, tonnage 1,919,301; foreign, 16,783, tonnage 2,641,494: the number that cleared—French, 8771, tonnage 1,527,205; foreign, 11,636, tonnage 1,644,473. The import duties levied by the Customs yielded in 1863, £6,492,600.

Religion.—The established religion is the Roman Catholic, but other sects are tolerated. There are 6 cardinals, 15 archbishops, and 65 bishops. In 1861 the Roman Catholics numbered 35,734,667 souls; Protestants, 1,561,250; Jews, 156,000.

Education.—France possesses a complete system of national education,—the law ordaining that in each commune there shall be one *école primaire*, and that every commune having above 6000 inhabitants shall have an *école primaire supérieure*. Each department, either individually or conjointly, is required to have a normal school for the training of teachers. The French colleges, of which there are 39 royal and 320 communal, resemble the schools of Eton or Harrow. All educational establishments, whether endowed or not, from the village school to the college or university, are comprehended under one great central administration, called *l'Universitié Imperiale de France*, presided over by a minister of state.

Government.—The supreme power is vested in the emperor. He exercises legislative authority conjointly with a senate of not more than 150 members elected for life by himself, a representative chamber of 261 members elected for 6 years, and a council of state. The French army, in 1863, consisted of 115 regiments of infantry, 64 regiments of cavalry, 22 of artillery, 3 of engineers, 6 squadrons of troops for the service of the administration, and 24 legions of gensdarmes; in all, 404,195 men. The navy consisted of 48 ships of the line, 91 frigates, and 319 corvettes, etc., carrying in all 9766 guns, and having a steam force of about 107,075 horse-power. The budget for 1865 estimates the revenue for that year at £76,342,043, and the expenditure at £76,236,630.

SPAIN.

South of France, and separated from it by the Pyrenees, is the kingdom of Spain. Besides the Pyrenees, it has on the N. the Bay of Biscay; on the E. it is bounded by the Mediterranean; S. by the Mediterranean, the Straits of Gibraltar, and the Atlantic Ocean; and W. by Portugal and the Atlantic. It is situated between 36° and 43° 45′ N. lat., and 3° 20′ E., and 9° 23′ W. long. Its greatest length from E. to W. is about 650, and its greatest breadth 550 miles; area, 178,874 square miles. The coast-line on the Mediterranean is about 750 miles in length, and on the Atlantic 600 miles. On the N. the coast is rocky and precipitous, but on the S.W. it is low and sandy. The Mediterranean coast is generally rocky, but there are some considerable exceptions. No other country of Europe of the same size has an equally diversified surface. The interior may be described as an elevated table-land, from 2000 to 3000 feet above the level of the sea.

Mountains.—Five principal mountain-chains, or *sierras*, traverse the country in a direction from E. to W. The most northern of these is the Pyrenees, which not only separates France from Spain, but, under the names of the Asturian and Cantabrian Mountains, extends parallel to, and at a short distance from, the N. coast of the latter country for about 600 miles. The culminating point is Maladetta, 11,168 feet above the level of the sea. Another chain, separating the basins of the Douro and Tagus, extends W.S.W. from the Ebro near Tudela, dividing Old and New Castile, Leon, and Estremadura, and thence running S.S.W. through Portugal to Cape Rocca, near Lisbon; the culminating point is the Sierra de Grados, 10,552 feet high, but its average elevation does not exceed 4500 feet. The third chain comprises the mountains of Toledo, Sierra Guadalupe, and Sierra Mames, and separates the basin of the Tagus from that of the Guadiana. The Sierra Morena forms the watershed between Guadiana and the Guadalquivir. The Sierra Nevada runs from Cartagena to Cadiz, and contains the highest point in the peninsula, the Cerro Mulhacen, 11,678 feet high.

Rivers.—Spain possesses numerous rivers, the chief of which are of great extent. The Ebro rises in the Asturian range near Reynosa, flows S.E. through a succession of narrow valleys, draining the S. slope of the Pyrenees, and falls into the Mediterranean about 26 miles below Tortosa, after a course of nearly 400 miles. Several smaller rivers flow eastward into the Mediterranean, the chief of which are the Guadalquivir, the Jucar, and the Segura. Five large rivers flow westward into the Atlantic. The most northern of these is the Minho, which rises in the northern part of Galicia, flows first S. to the borders of Portugal, and afterwards S.W., forming the boundary between the two countries to its mouth, and having a length of about 150 miles. Douro rises in the mountains of Old Castile, N. of Soria, and flows generally W. through Leon to Miranda, where it turns S., and for some distance forms the E. boundary of Portugal, and again takes a W. direction to its mouth. Its length is about 500 miles. The Tagus takes its rise in the Sierra Albarracin, on the borders of Aragon and New Castile, and flows W.S.W. through New Castile and Estremadura in Spain, and between Beira and Alemtejo, and through Estremadura in Portugal, to its mouth in the Atlantic, 2 miles below Lisbon. Its length is estimated at 540 miles. The Guadiana rises in the province of La Mancha, and flows first W. through New Castile and Spanish Estremadura to Badajoz, then turns S., flowing first between Spain and Portugal, afterwards through part of the Portuguese province of Alemtejo, and again forming the boundary between the two countries to its mouth in the Atlantic; length about 400 miles. The Guadalquivir has its source in Murcia, in an offset of the Sierra Sagra, flows generally W.S.W., and falls into the Atlantic Ocean 18 miles N. of Cadiz, after a course of about 320 miles. There are no lakes of any considerable size, but swamps and marshes are numerous and extensive.

Minerals.—The mineral resources of Spain are rich and various. The principal minerals are coal and coke, furnished chiefly by the provinces of Oviedo, Leon, and Cordova; iron by those of Malaga, Biscay, and Oviedo; lead by those of Murcia and Jaen; copper by the government mines of Riotento, in Huelva; quicksilver by the government mines of Almaden, in Ciudad Real; silver by the provinces of Guadalajara, Murcia, and Almeria; and gold in small quantities by the province of Leon. It is said that from 80,000 to 90,000 persons find employment in the mines, and that 20,000 beasts of burden are employed in them. The total value of the metallic productions of the country, raw and manufactured, exported in 1860 was £2,000,000.

Climate.—The climate of Spain is exceedingly diversified on account of the physical condition of the country. The central plateau is exposed to great heat in summer and extreme cold in winter, but on the coasts the temperature is more equable. On the N. and W. coasts westerly winds prevail, and being loaded with moisture from the Atlantic, discharge abundant rains in winter and spring. The fall of rain here is from 25 to 35 inches; whereas, on the central table-land it is only about 10 inches. On the coast of the Mediterranean the temperature is very hot in summer, and very mild in winter.

Commerce, etc.—From its geographical position, the extent of its coast-line, the number of its ports, and the value of its products, Spain possesses greater commercial advantages than any other country of Europe, but these are rendered of little avail by the restrictive measures of the government. Smuggling is carried on to such an extent that it is impossible to estimate the amount of its foreign commerce. The imports and exports in 1860, as shown by public documents, were respectively £14,833,135 and £10,982,034. The imports are chiefly dried fish and salted provisions, colonial goods, butter, cheese, rice, cotton and woollen goods, and cutlery; exports—wool, wine, oil, brandy, fruits, iron, lead, mercury, and salt. The revenue and expenditure for the year 1859 were respectively £17,947,318 and £17,866,627; and the amount of the public debt was £107,054,071. The army in 1862 numbered 234,261 men. The navy in the same year consisted of 169 vessels of all kinds. The government since 1833 is a constitutional representative monarchy. The established religion is Roman Catholic, and none other is tolerated. Education is very much neglected. Previous to 1834 Spain was divided into large provinces, having, for the most part, the title of kingdoms, from having at one time had separate monarchs; but at that date the territory on the continent and the adjacent islands were formed into forty-nine provinces, taking their names from their respective capitals, except Navarre, Biscay, Alava, and Guipuscoa, which retain their ancient names. The following table gives the area and population of the different provinces in 1857. The population in 1849 amounted to 14,216,219.

Provinces.	Area in English Sq. Miles.	Population, 1857.	Provinces.	Area in English Sq. Miles.	Population, 1857.
New Castile.			Cordova	4,146	351,536

			Islands.		
			Balearic	1,150	262,893
Andalucia.			Canary	3,210	234,046
Seville, Cadiz, Huelvas	8,963	463,486; 383,078; 174,391	Total	183,234	15,454,514

The chief towns, with their populations in 1857, were—Madrid, 475,785; Barcelona, 252,015; Seville, 152,000; Valencia, 145,512.

Agriculture.—The soil is generally fertile, except in the elevated and parched districts in the centre, where there are large tracts of mere sandy wastes. The chief crops are wheat, maize, barley, rice, hemp, and flax. Among its other products are cotton and the sugar-cane, madder, saffron, potatoes, beans, peas, cucumbers, melons, almonds, figs, pomegranates, lemons, oranges, dates, etc. Olive-trees are common in all except the higher northern parts; and vineyards are extensive, except in the more elevated regions. Spain contains, in round numbers, 120,000,000 acres, of which the cultivated lands are estimated to comprise about 61,000,000 acres; the olive fields occupy rather more than 8,000,000 acres, vineyards nearly 2,000,000, and other kinds of cultivated plantations nearly

3,000,000 acres. There are from 5,000,000 to 7,000,000 acres of irrigated meadow land, nearly 17,000,000 of uncultivated grass land, and nearly 19,000,000 of moor and waste. Forests occupy at least 3,700,000 acres; and nearly 20,000,000 acres are taken up by roads, rivers, buildings, etc. The annual produce of wine is estimated at 120,000,000 gallons. On the Pyrenees and Asturian Mountains are large forests of fine timber trees; but, on the whole, Spain has less timber than any of the other great countries of Europe; owing to a prejudice of the inhabitants against it. The most valuable of its trees are the cork-tree, the evergreen oak, the kermes oak, the sumach-tree, the chestnut, and the hazel. The horses, mules, asses, and sheep of Spain are celebrated.

Manufactures.—Manufacturing industry, formerly considerable, has greatly declined. Catalonia, Biscay, and Valencia are the most industrious provinces, and in them manufactures are most advanced. Silk, cotton, linen, and woollen fabrics, leather, paper, hats, soap, and cutlery, are among its chief manufactures. The government has still manufactories of tobacco, saltpetre, gunpowder, firearms, and porcelain; but they are all in an unhealthy state. The celebrated manufacture of swords at Toledo is nearly extinct.

Internal Communication.—There are no good public roads in Spain except those around the capital. Wheel-carriages are little used, much of the transport being effected by means of mules. Few of the rivers are navigable for a great length on account of the elevated nature of the country. The canals are mostly unfinished and unfit for navigation. The only one of importance is the Imperial Canal, commenced by Charles V., and extending along the S. bank of the Ebro. The first railway was opened in 1848, and since that time a number of others have been constructed; so that in 1859 there were 706 miles in operation.

PORTUGAL.

The Kingdom of Portugal occupies the S.W. portion of the Spanish or Iberian Peninsula, and is bounded on the N. by the Spanish province of Galicia; E. by those of Leon, Estremadura, and Andalucia; and S. and W. by the Atlantic Ocean. It is situated between 36° 56′ and 42° 6′ N. lat., and between 6° 15′ and 9° 32′ W. long., having a length from N. to S., from Melgaço to Cabo Santo Maria, of 356 miles, and a breadth from W. to E., from Cabo da Rocca to Campo Mayor, of 153 miles. According to the most recent Portuguese authorities, it has an area of 35,367 English square miles. The coast-line is about 500 miles in extent, and contains many fine harbours. The general configuration of the country resembles that of Spain, and indeed all its great rivers and mountain-chains originate in the latter country. A chain enters Portugal from Asturias in a S.W. direction, and forms on the N. the Serras de Gerez, Suaza, and Marao. The chain which in Spain separates New from Old Castile runs S.S.W. through Portugal to Cabo da Rocca, forming the Serra Estrella, the Junto, and the Serra da Cintra. The Toledo range forms in Portugal the Serras de Mamed, Ossa, and Vianna. The most southerly of the great chains is the Serra Monchique, which stretches through Algarve till it terminates in the steep cliffs of Cabo S. Vicente. Of the other mountain-chains and elevations, the chief are the Serres da Abelheira and Carheira in Alemtejo and Tras-os-Montes; Açor, in Beira; Alca Çovas, in Alemtejo; Falperra, in Minho; Altura de Trevim, Anciam, and Borralheira, in Beira. Soago, in Minho, the highest point of the Serra de Gerez, is 8000 feet high. From the prevailing mountainous character of the country, the plains are seldom of any great extent. A considerable portion of the country is heath, comprising all that territory extending from the Tagus southward to the mountains of Algarve, and from the coast eastwards to Beja and Evora. It includes the western and greater portion of Alemtejo and a part of Estremadura.

Rivers, etc.—Portugal is well watered by rivers and streams. The principal of these, which fall into the Atlantic, are the Minho, Douro, Mondego, Tagus, Sado, and Guadiana. All of these, with the exception of the Mondego and the Sado, have their sources in Spain, and have been already noticed. The sources of the Mondego lie in the Serra Estrella, whence it has a course of about 120 miles, 60 of which are navigable. The Sado rises in the Serra Monchique, near Almodovar, and has a length of 110 miles, for about 50 of which it is navigable. The principal lagunes are those of Barinha and Mira, in the province of Douro, and Obidos, in Estremadura. The chief lakes are in the province of Beira—the Arrestel, in the Serra of the same name, and the Escura in the Serra Estrella. In Estremadura are the two small lakes of Diabroria, near the small town of Grandola, and Brescos, near S. Andre.

Climate.—The climate resembles that of Spain, and is in general healthy. The heat on the coast is tempered by the sea-breezes. Snow rarely falls in the S. provinces, but among the mountains in the N. it is common. Rain is very abundant on the W. coast, particularly from October to April. The mean annual temperature at Lisbon is 61·3°, and at Coimbra 62°. Earthquakes are frequent in various parts, particularly about Lisbon.

Agriculture.—The soil is naturally fertile, but agriculture is in a very backward state. Wheat, barley, oats, hemp, flax, and other products, are raised on the high lands, while rice and maize are among the productions of the low country. The chief fruits are olives, oranges, figs, and almonds. The cultivation of the vine constitutes the most important branch of industry. The red wine, termed *port*, from its being shipped at Oporto, is produced in the Upper Douro, on a succession of small hills on both sides of the river, about 50 miles above Oporto. The registered produce of 1863 was 82,866 pipes. Cattle and sheep are reared in considerable numbers, but the wool of the latter is not of fine quality. Goats and hogs are numerous, and the hams of the latter are famous. The principal beasts of burden are mules and asses; horses are scarce, oxen being chiefly used for draught in the provinces. Fish abound in the rivers and on the coast.

Minerals.—Portugal has considerable mineral wealth, but it has been little developed. Coal is found in various parts, and mines of iron are wrought; but with the exception of salt, of which a large quantity is annually produced, the other minerals are comparatively neglected. Among these are gold, silver, tin, lead, antimony, sulphur, arsenic, and mercury. Marble of the finest quality abounds, as well as porcelain and other clays.

Manufactures.—The manufactures are few and unimportant, being chiefly woollen, silk, linen, and cotton stuffs, paper, glass, earthenware, jewellery, arms, and gunpowder. They are said to excel in embroidery and in the making of lace; and ship-building to a considerable extent is carried on.

Commerce.—The trade of the country is chiefly in the hands of foreigners, and is mostly carried on with England and Brazil. In 1856 the total value of imports by sea for home consumption was £4,424,742, and £786,290 by land; the exports of domestic produce by sea were £3,387,745, and colonial produce £18,367, besides £261,170 exported by land. The number of vessels that entered in that year was—sailing vessels 8,044, tonnage 511,214; steam vessels 518, tonnage 157,591: that left—sailing vessels 8,460, tonnage 532,937; steam 535, tonnage 210,387. The declared value of imports at the port of Lisbon during the year 1861-2 was £2,210,678; of exports, £2,742,202.

Internal Communication.—The means of communication between different parts of the country are very deficient. On account of its many large rivers there is a considerable extent of river navigation, probably about 500 miles, but it has few canals, and the roads are almost all in an extremely wretched condition. Railways have recently been introduced, and at present there are about 160 miles in operation.

Government, etc.—The government is a constitutional monarchy, with a chamber of peers and a chamber of deputies. The former consists of 1 cardinal, 2 archbishops, 6 bishops, 3 dukes, 10 marquises, 39 counts, 23 viscounts, 10 barons, and 25 untitled gentlemen, whose offices are for life and hereditary. The chamber of deputies is composed of 131 members, elected by 37 districts of the continental portion of the kingdom, 11 representing the Azores and Madeira, and 14 from the foreign possessions. The president is nominated annually by the crown. The state religion is the Roman Catholic, and no other is openly tolerated. It is under a cardinal, 3 archbishops, and 20 bishops. The Inquisition was abolished in 1821. The budget for 1863-4 estimates the revenue and expenditure at £3,458,534 and £3,804,829 respectively. The public debt at 30th June 1862 was £33,717,102. The entire active land force at 31st July 1863 was 20,239 men, and 2,306 horses; the navy of 35 vessels, bearing in all 296 guns. The population in 1841 amounted to 2,412,500, and in 1854 to 3,499,121. The following table gives the area and population of the several provinces of the kingdom, including the Azores and Madeira, which are administratively included within it:—

Provinces.	Area in Square Miles.	Population in 1863.	Provinces.	Area in Square Miles.	Population in 1863.
Minho	3,121	887,859	Algarve	2,160	157,666
Tras-os-Montes	4,020	340,186	Azores	3,531	240,548
Beira	8,636	1,210,056	Madeira	749	101,420
Estremadura	7,284	785,866			
Alemtejo	10,056	311,729	Total	39,547	4,035,330

The chief towns, with their populations, are—Lisbon, 275,286; Oporto, 81,447; Braga, 18,000; and Coimbra, 15,200.

GERMANY.

Germany is an extensive country of Central Europe, lying between 45° and 55° 30′ N. lat., and between 6° and 20° E. long.; and bounded on the N. by the German Ocean, Denmark, and the Baltic; E. by Prussia, Poland, Galicia, Hungary, and Croatia; S. by the Adriatic Sea, Italy, and Switzerland; and W. by France, Belgium, and Holland. This country comprises the territories of the 35 states that form the Germanic Confederation, the estimated area being 243,054 English square miles, or about the sixteenth part of Europe.

Surface.—Its surface is much diversified by mountain and valley, table-land and plain. The southern and central parts are traversed in every direction by ranges of mountains and hills, sometimes separated only by narrow valleys, and sometimes by large table-lands or plains; while the northern portion of the country sinks into a wide sandy moorish plain little elevated above the level of the sea. The Tyrol and the S.E. provinces of Austria are occupied by branches of the Alps, which frequently present long narrow valleys and dismal precipices. Immediately N. of this region lies the valley of the Danube, which in Bavaria expands into a plain of considerable extent. Further N. the middle region of Germany is occupied by ranges of hills, which form a series of elevated valleys and table-lands—a region abounding in verdant and well-wooded valleys, and diversified by much picturesque scenery. N. of this hilly region, the country sinks gradually into plains which extend through Lower Silesia, Lusatia, Brandenburg, Pomerania, Mecklenburg, Holstein, Hanover, and the lower part of Westphalia.

Mountains.—The Rhaetian Alps, extending E. from Switzerland, occupy the provinces of Vorarlberg and Tyrol, and are divided into two branches by the valley of the Inn, the northern being termed the Algauer Alps, the southern the Tyrolese Alps. In this chain is the loftiest mountain of Germany, the Ortler-Spitz, 12,810 feet in height. Further E. lie the Noric and Carnic Alps with their various branches, occupying the greater part of the Austrian territory S. of the Danube. Westward of the Rhine, the Vosges Mountains extend into the lower palatinate of Bavaria under the names of the Wasgau Mountains and the Hardtwald, the highest of which, the Donnersberg, rises to the height of 2300 feet. The Hochwald and Hundsruck fill up the rest of the country between the Rhine and the Moselle. North of the latter river the country is occupied by the Eifel Mountains and branches of the Ardennes, whose eastward range is cut through by the valley of the Rhine. In the angle formed by the Rhine in its course from the Lake of Constance to Mentz, and N.W. of the Upper Danube, the country is traversed by the various diverging ranges of the Schwartzwald or Black Forest, the Rauhe Alp, the Odenwald, and the Steigerwald, which are terminated northwards by the valley of the Meyn. North of that river, between the Rhine, the Saale, and the Elbe, are the Taunus, the Westerwald, the Ohreberg, in Nassau, Hesse, and Rhenish Prussia; the Rodhaar and Eggsgebirge, in Westphalia and Waldeck; the Osning or Teutoburgerwald, in Lippe, Westphalia, and Hanover; the Höhe Rhön and the Spessart, in Bavaria and Electoral Hesse; the Vogelgebirge, in Upper Hesse; the Frankenwald, Thuringerwald, and the Hartz Mountains, in Bavaria, the Saxon Duchies, and Hanover. East of the Meyn and the Saale are the Fichtelgebirge, in the upper palatinate of Bavaria; the Boehmerwald on the S.W., the Erzgebirge on the N.W., the Riesengebirge or Sudetic Mountains, and the Geisenkergebirge on the E. and N.E., and the Zdarsky-Hory on the S.E. of Bohemia.

Rivers.—Germany is watered by numerous rivers, the principal of which are the Rhine, the Elbe, the Oder, and Vistula, already noticed under Europe. The lakes belong chiefly to the Alpine region in the S., or to the plain of the Baltic in the N. There are few lakes in the centre. To the former class belong the Lake of Constance, the Ammer See, Warm See, Chiern See, etc. The Lakes of N.

Germany are mostly shallow marshes, but some of them are of very considerable extent.

Minerals.—No part of Europe yields a greater variety or a greater abundance of mineral productions than Germany, and in no part of the world are the mines worked with so much skill and economy. Gold is found in Austria and Bavaria; silver and cannabar are raised from the mines of Erzgebirge in Saxony; and iron, copper, lead, tin, calamine, bismuth, cobalt, nickel, arsenic, and almost every other mineral, are found more or less plentifully in different parts. The coal measures are widely distributed, as in Bohemia, Silesia, Rhenish Bavaria, and Rhenish Prussia. Austria and Prussia being the two great mining countries of Germany, the quantities of the different mineral products will be noticed under the accounts of these countries. Germany is particularly rich in mineral springs, including chalybeate, sulphureous, alkaline, saline, and warm.

Climate.—The climate of Germany as regards heat and cold is much more uniform than might have been expected, seeing that it extends over 10° of latitude. This arises from the country being elevated in the central and southern parts, and low-lying in the N. Generally the mean annual temperature ranges only between 45° and 50° Fahr. The mean temperature of the coldest month varies from 29° at Munich to 26° at Stralsund, and of the warmest month from 67° at Innsbruck to 62° at Gotha. There are, however, certain parts of Germany that enjoy a much milder climate, as the low-lying districts in the S., and those along the banks of the Rhine. At Trieste, on the Adriatic, the mean annual temperature is 58°. The low country in the N. has a much moister and more variable climate than the rest of Germany. The annual fall of rain on the plains is, in the basin of the Rhine 26½ inches, of the Weser 26½ inches, of the Elbe and the Oder 23 inches, and of the Danube 32 inches. The quantity of rain that falls in summer is more than double that which falls in winter; and the number of rainy days in the year is 150.

Government, etc.—As settled by the treaty of Vienna in 1815, Germany was divided into 39 sovereign states or portions of states, but the number is now reduced to 34. They are all united into a *Bund* or confederation, the object of which is the maintenance of the external and internal peace of Germany. The confederation is represented by the Diet, which is composed of the plenipotentiaries of all the states. The ordinary business of the Bund is managed by a permanent Diet at which the plenipotentiary of Austria presides; but as there are only 17 votes, Austria, Prussia, Bavaria, and the larger states have 1 each, and only 6 are allotted to the smaller states and cities. When fundamental laws are to be made or changed, or any important measures to be introduced, the Diet becomes a general assembly (*plenum*), with 70 votes, of which Austria and five of the larger states have 4 each, five others have 3 each, three have 2 each, and the rest 1 each. The Diet holds its sittings at Frankfort-on-the-Maine. The federal army, contingent and reserve, amounted in 1863 to 734,599 men. The following table gives the area and population of the different states in 1861:—

States.	Title.	Area.	Pop. 1861.	States.	Title.	Area.	Pop. 1861.
Austria	Empire.	75,132	12,802,944	Oldenburg & Knip-hausen	Grand Duchy.	2,421	295,242
Prussia	Kingdom.	71,734	14,138,804	Anhalt (Dessau-Cöthen-Bernburg)	Duchy.	1006	181,824
Bavaria	,,	29,370	4,689,837	Schwartzburg Sondershausen	Principality	359	64,895
Saxony	,,	5,772	2,225,240	Schwartzburg Rudolstadt	,,	367	71,913

Agriculture.—In many parts of Germany, agriculture is in a very advanced state. Mecklenburg in particular and Holstein are noted for the excellence of their husbandry; and in Hanover, Brunswick, Bohemia, Saxony, and some parts of Prussia and Austria, it is scarcely inferior. Generally speaking, agriculture is the principal occupation of the inhabitants, particularly those of Bavaria, Wurtemberg, Baden, Hesse, Nassau, Hanover, Brunswick, Oldenburg, Prussia, Anhalt, Holstein, and Mecklenburg. In Saxony, the Saxon Duchies, Schwartzburg, Reuss, and some districts of Prussia, manufactures employ an equal, and in some cases even a greater number of the people. Wheat, rye, barley, and oats are the cereals most generally cultivated; but in some districts to these are added spelt, buckwheat, millet, emmer (*Triticum dicoccum*), einkorn (*Triticum monococcum*), and maize. The potato is largely cultivated, not only for food but also for distillation. Beans, peas, vetches, and lentils are also largely grown; as is likewise the beet in certain districts for the production of sugar. Flax, hemp, and tobacco are cultivated, though, as regards the first two, not to so great an extent as formerly. The agricultural crops occupy about 61,000,000 acres; meadows, 16,000,000; gardens, 2,500,000; vineyards, 700,000; woods and forests, 41,000,000. The fruits of temperate climates are largely produced: apples, pears, cherries, and plums are everywhere common; and the more delicate fruits, as the peach and apricot, are found in the warmer districts. Vines are grown to a large extent in the S. and W., particularly along the Middle Rhine and the Lower Danube. The annual value of the wine produced is about £3,000,000. The forests are extensive, particularly on the hills and mountain-ranges, and on this account many of the latter have *wald* (wood) attached to their names. They consist chiefly of firs, pines, larches, beeches, and oaks. Wild animals abound all over Germany, among which are the boar, wolf, fox, bear, lynx, roe, stag, hare. The chamois and marmot are numerous on the Alps. Of domestic animals, the most common are horses, cattle, sheep, and swine. Westphalia and the districts bordering on the lowlands furnish excellent swine; and Saxony, Silesia, Bohemia, and Moravia rear the finest sheep. The finest breed of German horses is to be found in Mecklenburg and North Hanover. There are in Germany about 2,700,000 horses, 16,000,000 cattle, 25,000,000 sheep, and 5,600,000 swine.

Manufactures.—In many branches of industry the Germans have reached a high degree of excellence. The linens of Germany, particularly those of Bielefeld and Silesia, are highly esteemed. Of late years, the introduction of cotton and the high prices obtained for corn have tended greatly to lessen the cultivation of flax, which was formerly a principal staple of agricultural industry, and the linen manufacture has suffered in consequence. With the improvement of the breeds of sheep within the last half century the woollen manufacture has made great progress. Its chief seats are in Brandenburg, Saxony, Bohemia, Moravia, and Rhenish Prussia, from which it is exported to all parts of the world. The cotton manufacture has been established, and is rapidly extending in Saxony, Austria, and along the Rhine. The silk manufacture is successfully carried on in Vienna, Roveredo, Gorz, Berlin, Elberfeld, and other places. Works in metal, especially iron and steel, are produced in great perfection and in great quantities in Styria, Austria, Rhenish Prussia, Westphalia, and the district of the Hartz. Pottery and glass-making have reached a high degree of perfection; the porcelain of Vienna, Berlin, and Meissen is much in request, and Bohemian glass is to be met with in all parts of the world. Leather, soap, paper, sugar, beer, and brandy, are among the chief of its other products.

Zollverein.—The commerce of Germany was formerly much impeded in consequence of each of the states of Germany having its own custom-houses, tariff, and revenue laws, which frequently differed widely from those of its neighbours. Recently most of the German states have entered into a customs league (*Zollverein*), in accordance with which the duties are charged along the frontiers of the contracting states, and afterwards divided among the states according to their respective populations. We give the area and population of the various states composing the Zollverein, as they differ in most cases from what has been already given, the natural boundaries of the states not being followed:—

States.	Area.	Pop. 1861.	States.	Area.	Pop. 1861.
Prussia, &c.	109,314	18,867,061	Hesse, Grand Duchy	3,267	874,231
Luxemburg	975	197,731	Thuringen	5,028	1,069,821
Bavaria	29,589	4,695,424	Brunswick	1,337	257,624
Saxony	5,766	2,225,240	Oldenburg	2,060	238,562
Hanover	15,016	1,908,631	Nassau	1,794	454,326
Wurtemberg	7,686	1,720,708	Frankfort	23	84,506
Baden	5,891	1,365,732			
Hesse, Electorate	4,300	710,680	Total	192,706	34,670,277

The nett sum collected for distribution among the different states was in 1862, £348,750.

Internal Communication.—The numerous navigable rivers which intersect Germany, and the canals by which these are connected, afford it great facilities for trade, and these have latterly been much increased by the construction of railways, which connect all the principal towns. In 1863 there were in Germany about 8,000 miles of railway in operation. The carriage roads are in general good.

Religion.—With the exception of Jews, the population belong either to the Protestant or Roman Catholic Church. The Protestants, of which there are two classes, Lutheran and Reformed or Calvinistic, prevail in the north, while the Roman Catholics are the most numerous in the south.

Education.—Germany is in point of education in advance of every other country of Europe. Schools of different kinds have been established, and parents are compelled to send their children to the schools, unless it be shewn that they are otherwise receiving instruction. There are 24 universities in Germany, with 1697 professors and teachers, and about 17,600 students.

Duchies, late Danish.—These are Schleswig, Holstein, and Lauenburg, which formerly belonged to Denmark, but were taken possession of by the allied German forces in the war of 1863-4, and their possession afterwards confirmed by the peace of Vienna which followed. The total area is upwards of 7200 square miles, and the population in 1860 was 1,004,473. The duchy of Schleswig is of an oblong form, about 70 miles in length by from 36 to 56 in breadth, and has an area of about 3320 square miles. A range of hills traverses the duchy from N. to S., east of which are fruitful and well-cultivated fields, interspersed with patches of woodland, while to the west the ground gradually slopes into a plain covered with moors and marshes. A large part of the interior is dry and sandy. Holstein is much more productive than Schleswig, and has an area of 3,490 square miles. The soil along the coast is a rich alluvium, but in the interior it is lighter and in some degree sandy. The inhabitants are chiefly engaged in the rearing of cattle; and the horses, which are noted for their shape and spirit, are exported in large numbers to France, Germany, and Russia. Lauenburg extends along the N. bank of the Elbe above Hamburg, and has an area of 400 square miles. The surface in the N. and W. is flat, but in the S., along the Elbe, it assumes a hilly character. The soil is generally fertile, and the inhabitants are mostly engaged in agriculture. Holstein and Lauenburg formed part of the German Confederation, and the King of Denmark, as representing such, had a voice in the Diet; Schleswig was an integral portion of the Danish Kingdom.—*See* Denmark.

AUSTRIA.

Austria, one of the largest and most important of the European states, is situated in Central and Southern Europe, and extends from 42° to 51° N. lat., and from 9° 30′ to 26° 30′ E. long. Its greatest length from W. to E. is about 800 miles, and its greatest breadth about 510 miles; area, 247,900 square miles, about 8000 square miles of Lombardy having been, by the treaty of Villafrancha, taken from Austria, and ceded by France to Italy. On the N. it is bounded by Russia, Prussia, and Saxony; W. by Bavaria, Switzerland, and Italy; S. by Italy, the Adriatic and Turkey; and E. by Turkey and Russia.

Mountains.—The Austrian Empire presents every variety of surface, but the greater part of it is mountainous. Two extensive mountain systems overrun with their ramifications most parts of the empire. These are the Alps in the S.W., and the Carpathians in the N.E. The most mountainous districts are Tyrol, Styria, Carniola, Carinthia, and Dalmatia. In some regions the scenery is bold and romantic, and has been compared to that of Switzerland. Styria in particular bears a considerable resemblance to Switzerland, having, like that country, its cascades, glaciers, avalanches, and perpetual snows. The loftiest summit is Ortler-Spitz, in Tyrol, which attains the height of 12,810 feet. The mountains are frequently covered with vegetation, and cultivated to a considerable height. Between the mountain-ranges we frequently meet with valleys of considerable extent, particularly towards the south. On the banks of some of the principal rivers large plains occasionally occur. Hungary contains two very extensive plains, and in the south is the northern part of the great plain of the Po.

Rivers.—The most important river of Austria is the Danube, which drains

about two-thirds of the entire territory. The other large rivers are the Dniester, Po, Adige, Elbe, and Vistula, which have been already noticed under EUROPE.

Lakes.—The lakes and marshes are numerous, and some of them are very extensive. The two most extensive lakes are the Neusiedler and Balaton, in Hungary. The chief of the others are Garda, on the S. side of the Alps, and the Traun See, the Atter See, and the Mond See, on the N. Large marshy tracts extend along the banks of the larger rivers of Hungary, Galicia, and other level districts.

Climate.—From its extent, as well as from the irregularities of its surface, the climate of Austria is necessarily very varied. It is usually divided into three regions or zones—the northern, middle, and southern. The first of these is situated between the 49th and 51st parallels of N. lat., and comprises nearly the whole of Bohemia, with the high-lying parts of Hungary, Moravia, Galicia, and Bukowine, extending over a surface of about 70,000 square miles. The climate here, though colder in winter and warmer in summer, bears on the whole a considerable resemblance to that of England. Its chief products are wheat, barley, oats, and rye. The middle region is considerably more extensive, having an area of fully 150,000 square miles, between lat 46° and 49° N., and containing the whole of Lower Austria, with the chief parts of Upper Austria, Moravia, Hungary, Transylvania, and Galicia. The summer and autumn heats are here much greater than in England, and in addition to wheat and the other products already mentioned, vines and maize are cultivated in favourable situations. The southern region, lying between lat. 46° and 42° N., comprises the Venetian states, the coasts of Croatia and Dalmatia, with the southern line of Sclavonia and the Barnat of Temesvar. In these districts the winter lasts only for two or three months, and the cold seldom exceeds that of the month of March in England. Here are raised not only maize and vines, but olives, myrtles, and other southern products. To this general account it is necessary to add, that in no country of Europe do greater differences of temperature occur in the same latitude, in consequence of the very marked differences in the elevation of the soil. The greatest quantity of rain falls south of the Alps, where it frequently amounts to 40 inches and upwards; the least in the central parts of Hungary and Dalmatia, where the annual fall is only about 12 inches.

Agriculture.—Every species of soil is to be met with; but the most productive regions are the plains of Hungary and Venice. Agriculture has made little progress in Austria during the last thirty or forty years; and if we except Venice and the Archduchy of Austria, it is in a backward state in all parts of the empire. The people are still ignorant of those recent improvements that have so much increased the agricultural products of those countries where they have been fully carried out, and hence even the most fertile lands do not produce more than a half or two-thirds of the amount they might be made to do. The estimated number of acres arable, and in vineyards, meadows, woods, etc., in 1859 are given subsequently in the table of the population. The estimated produce of that year was, in English bushels, of wheat, 82,592,800; rye, 109,680,600; maize, 73,229,200; oats, 169,224,800; barley, 84,928,600; potatoes, 203,153,400; rice, 567,600 cwt. In 1859 there were 3,460,399 horses; 14,257,166 cattle; 23,781 mules and asses; 16,964,236 sheep; 1,527,825 goats; and 8,151,608 swine in the empire. In Styria, Illyria, and Tyrol the rearing of cattle forms the chief branch of agricultural industry. Hungary and Venice grow large crops of wheat, maize, and rye. The rearing of the silkworm is largely carried on in various parts. Hemp, flax, tobacco, hops, and saffron are grown. The vine is extensively cultivated in the central and southern parts of the empire; but the wine is of inferior quality, and is chiefly used for home consumption.

Minerals.—With probably the exception of Russia, no country in Europe is equal to Austria in mineral resources. There is scarcely a metal that is not to be found there, and most of them are in great abundance, though, from the lack of means of conveyance, they are not developed to such an extent as they might be. The total annual value of the mineral products in 1859 was £3,912,396; of which, gold, £211,178; silver, £293,165; quicksilver, £69,475; tin, £6,298; zinc, £22,000; copper, £253,273; lead and litharge, £181,583; iron, raw and cast, £2,040,660; graphite £5,828; stone coal, £828,939. The principal mining districts are Transylvania, Hungary, Bohemia, Tyrol, Styria, and Salzburg. Salt mines are found in various parts, and especially on each side of the Carpathian chain,—those of Bochnia and Wieliecka, in Galicia, being the greatest in Europe. The amount of rock-salt mined in that year was about 4,000,000 cwts.; and nearly an equal quantity was obtained from brine springs and sea-water. There is a very great number of mineral springs. Precious stones and building stones of every description are common.

Manufactures.—The manufactures have been making great progress in Austria since the peace of 1815. Cloth, merino shawls, printed cotton goods, and a great variety of articles of luxury, are produced in great excellence in and near Vienna. Vienna, Venice, and other towns of North Italy, furnish silk manufactures. Moravia, Silesia, and Bohemia have acquired a high reputation for the manufacture of glass and crystal wares, as well as linen and woollen goods. Styria and Carinthia are the chief seats of the iron and steel and other metallic manufactures. An immense quantity of jewellery, watches, etc., is produced in Vienna, Gratz, Venice, and Prague. The total annual value of the manufactures is about £120,000,000. The iron and steel manufactures amount to about £5400 annually; glass and crystal manufactures, £1,800,000; earthen and china wares, £1,150,000; chemical preparations, £5,500,000; linen goods, £13,100,000; woollen goods, £10,650,000; cotton goods, £8,000,000; silk goods, £600,000.

Commerce.—The heavy restrictions till very recently in force on foreign trade, together with the small extent of her sea-coast, limited the commerce of Austria almost entirely to internal traffic. Up to 1848 the Austrian tariff was the highest in Europe; and many articles of trade were entirely prohibited. Customs boundaries also existed between several of the provinces; but these were abolished in 1850. In 1853 farther facilities for trade were introduced. The construction of railways have also exercised a very beneficial influence upon its commerce. Austria has only about 500 miles of sea-coast, which extend along the N. and E. shores of the Adriatic, from the mouths of the Po on the W. to Cattaro on the E. The three commercial seaports are Venice, Trieste, and Fiumi. The harbours along the coast of Dalmatia are both numerous and commodious; but their trade is insignificant. In regard to foreign commerce, Trieste occupies the foremost place, from the existence of the Lloyd Company, established in 1833, and three years afterwards taken under government patronage. In 1862, 10,905 vessels, of 769,352 tons, entered, and 10,810 vessels, of 774,910 tons, left the port of Trieste. The number that entered and left the port of Venice was not more than half of the above; and Fiumi had still less. The mercantile fleet is divided into three classes—the first, comprising the largest vessels, enjoys the privilege of going to any country of the globe; the second class, comprising vessels of smaller capacity, is only permitted to visit the ports of the Mediterranean; while the third and smallest class is restricted to Austrian ports. At the end of 1862 there were 537 sailing vessels, of 207,628 tons, of the first class; 2702, of 78,975 tons, of second class; and 6527, of 23,396 tons, of third class, including fishing barks. The number of steam-vessels was 51, of 21,338 tons, and 11,570 horse-power. The total value of the imports in 1862, £21,491,849, of the exports £33,285,301. The most important markets for internal trade are Vienna, Linz, Salzburg, Brunn, Olmutz, Pesth, Prague, and Verona.

Internal Communication.—The large navigable rivers of Austria, flowing in different directions, are in such a country of immense value, as affording means of easy communication between distant parts. There are in all 4850 miles of river navigation. The canals are of limited extent, and are confined to the territories of Hungary and Venice. There are 15,800 miles of roads, generally in excellent condition, and some of them are remarkable as works of art. The first railway in Austria was the Linz-Budweis, of which about seventeen miles were opened in 1828. In 1861 there were 3402 miles of railway in operation.

Population.—In 1842 the population of Austria, exclusive of Hungary, amounted to 25,304,152; and that of Hungary was estimated at about 12,000,000. By the treaty of Villafrancha in 1859, Austria was deprived of about 3,000,000 of inhabitants; but at the end of 1861 the population was estimated to have reached 37,000,000. Exclusive of the military, which amounted to 579,989, the entire population in 1857 was 34,438,999, as in the following table, in which is also given the amount of productive land, etc., in 1859, in Austrian *Jochs*, each of which is equal to 1·43 English acres:—

Districts.	Area in Eng. Sq. Miles.	Population in 1857.	Arable and Rice Fields.	Meadows, Gardens, &c.	Pastures.	Forests.	Vineyards.
Lower Austria ..	7,420	1,681,697	1,414,383	447,534	249,559	1,109,517	79,816

The chief towns of Austria, with their populations in 1857, are—Vienna, 476,222; Prague, 142,588; Pesth, 131,705; Venice, 118,172. The inhabitants of Austria are connected by no natural tie, except that of being under a common sovereign; they differ in race, language, religion, as well as in manners, customs, and institutions. In 1857 the population consisted of 7,889,925 Germans; 15,027,646 Slavonians; 5,632,089 Italians; 4,947,134 Magyars; the rest being Jews, Gypsies, Greeks, Armenians, etc.

Religion.—The Roman Catholic is the established and predominant religion of the empire; but toleration is extended to other sects. The clergy are both numerous and powerful, although their wealth has been much diminished by the confiscations and secularisations of the Emperor Joseph II. (1765-90). The empire is ecclesiastically divided into 15 archbishoprics and 76 bishoprics. In 1857 there were 23,968,686 Roman Catholics; 3,536,689 united, and 2,921,639 disunited Greek Church; 1,218,831 Lutherans; 1,963,785 Calvinists; 50,870 Unitarians; and 1,049,871 Jews.

Education.—Education has recently been making rapid advances in Austria. The law requires that an elementary school be established in every village; and that every child, between the ages of six and twelve, shall be educated either in the school or at home. In 1857 there were 3,732,862 children attending the various educational institutions of the empire. Of these, the number attending the superior institutions, universities, etc., was 23,128; middle schools, 72,646; military schools, 7075; other schools for boys, 11,334; for girls, 23,463; mixed, 1696; national schools, 3,593,504.

Government, etc.—The supreme and absolute power, whether legislative, judicial, or executive, is vested in the Emperor. He is assisted by a council of twelve members, with six administrative boards for the several departments of home and foreign affairs, justice, finance, commerce, and religion and education. There is a house of lords composed of 109 members, being princes of the imperial house, chiefs of the highest noble families, archbishops, bishops, and certain nominated members. There is also a house of representatives, consisting of 343 members. The crown is hereditary in the order of primogeniture in the male, failing which, in the female line. The budget for 1864 gives the ordinary revenue at £52,167,709, the extraordinary at £5,939,647; the ordinary expenditure at £51,250,071, the extraordinary at £10,211,270. The public debt in 1862 amounted to £252,671,864. The active army consists of 185,182 infantry; 39,188 cavalry; 27,661 artillery; besides 8932 engineers; a pioneer corps of 12,862; and a gendarmerie of 10,500 men. The navy consists of 117 vessels of various kinds, carrying in all 1084 guns.

PRUSSIA.

The kingdom of Prussia, exclusive of some small detached portions, is composed of two large, unequal, and perfectly distinct tracts of country about 40 miles apart, and separated from each other by Brunswick, Hanover, and the electorate of Hesse. The eastern and larger portion extends from the Baltic and Russian frontier towards

the centre of Germany. It lies between lat. 49° 40′ and 55° 50′ N., and long 9° 50′ and 22° 50′ E., and is bounded on the N. by the Baltic; W. by Hanover, Brunswick, Mecklenburg, and Electoral Hesse; S. by Austria and Saxony; and E. by Russia. The western portion comprehends Westphalia and Rhenish Prussia, and extends on both sides of the Rhine, between lat. 49° 5′ and 52° 15′ N. and long. 6° and 9° 30′ E. It is surrounded by Holland, Belgium, France, Hanover, and other German states.

Surface.—The surface of Prussia is generally flat, the greater part of it belonging to the great plain of Europe. The eastern portion slopes almost imperceptibly from the southern frontier towards the Baltic, the shore of which is low and sandy. There are no mountains except in the S.W., where portions of the Hartz Mountains and the Thüringerwald traverse the province of Saxony; and on the S.E. frontier, where the Riesengebirge or Giant Mountains extend along the S. border of Silesia. Ranges of elevations occur in other parts, but they nowhere assume the character of mountains. The western portion of the state is divided into two parts by the Rhine. Each of these consists of a table-land and a low plain. The table-lands are of similar elevation, being in the S.E. about 2000 feet high, but decreasing to about 1600 feet in the central parts. The N. and W. portions are low and flat. The Rhine between the two table-lands flows through a deep narrow valley noted for its picturesque beauties.

Rivers and Lakes.—Prussia is extremely well watered by rivers and streams. The principal rivers are the Rhine, Elbe, Oder, Vistula, Niemen, Pregel, Wartha, Moselle, Ems, and Spree. The Rhine, which intersects the western portion of the state, is navigable for its entire length in the territory, as is also its affluent the Moselle. The Elbe and Vistula, rivers of the eastern portion, are likewise navigable for their entire length in Prussia. The Oder is navigable for barges as far as Ratibor in S. Silesia, and the Pregel and Niemen are both navigable to a considerable distance. The navigable rivers of Prussia are numerous, owing to the flatness of the country through which they flow. On the coasts of the Baltic are several very large lagoons or Haffs, as the Curische Haff, the Frische Haff, and the Stettiner Haff, or the Great Haff, at the mouth of the Oder. There are an immense number of lakes in Prussia, generally of small size, and chiefly in the N. and E. provinces.

Climate.—The climate of Prussia varies considerably in the different parts. In Western Prussia the mean annual temperature is 49·5° Fahr., the mean of summer being 63°, and of winter 35°; in Central Prussia the mean annual is 48°, mean summer 64°, mean winter 33°; and in Eastern Prussia the mean annual is 43°, mean summer 61°, and mean winter 26°. Along the Baltic it is usually cold and humid, particularly towards the E., where the winters are long and severe.

Agriculture.—The soil is generally good, and in some parts of great fertility, but there are also extensive tracts of heath, moor, and loose barren sand. Agriculture forms the principal pursuit of the inhabitants, and it is generally conducted with great care. There are almost 2,000,000 farms in the kingdom, mostly of small size, one-half being under 5 morgens, or 3·15 English acres, and only one and a half per cent of them being more than 189 acres. The distribution of the soil is given in a subsequent table. The productions of the principal crops in imperial quarters were, according to a recent return—Wheat, 3,674,063; rye, 12,020,250; barley, 3,600,000; oats, 14,218,125; potatoes, 52,593,750. There were in 1859, 39,180 acres of vineyards, chiefly in the Rhine territory, and the wine produced in that year amounted to 6,369,250 imperial gallons. In 1858 there were 1,622,400 horses, 7677 mules and asses, 5,527,402 horned cattle, 15,374,717 sheep, 667,145 goats, and 2,589,371 swine in the kingdom.

Minerals.—The great mining districts of Prussia are Rhenish Prussia, Westphalia, Saxony, and Silesia. Here are found iron, coal, peat, zinc, copper, tin, antimony, arsenic, cobalt, etc. In 1859 the number of persons employed in the mines was 108,655, and the value of the various products £4,633,658. The number of persons employed in the smelting works, foundries, etc., was 54,491, and the value of the produce £9,546,383. In 1860, 53,579,461 tons of coal were produced, 2,355,523 tons of iron ore, 6,071,916 cwt. of zinc ore, 1,666,412 cwt. copper ore, and 894,432 cwt. lead ore.

Manufactures.—Prussia has recently made great progress in various branches of manufacture, especially in those of linen, woollen, and cotton goods. Saxony, Silesia, and Rhenish Prussia are the great manufacturing districts. In 1858 there were 1320 wool-spinning factories, having 660,025 spindles, and employing 16,279 hands; 127 cotton-spinning factories, with 333,677 spindles and 6933 hands; 13 flax-spinning factories, with 74,903 spindles and 4304 hands; and 8 tow factories, having 14,572 spindles and 913 hands. There were also employed in weaving silk, 36,204 looms, with 40,366 hands; cotton, 76,269 looms, with 76,110 hands; linen, 45,659 looms, with 45,941 hands; woollen, 30,019 looms, with 34,170 hands. A great number of persons are employed in working the metals. About 12,000 persons are employed in the manufacture of tobacco, 15,000 in that of sugar from the beet-root, 13,000 in brewing, and 15,000 in distilling.

Commerce.—Prussia has about 350 miles of coast along the Baltic, on and near which the chief commercial towns are—Memel, Pillau, Königsberg, Dantzic, Swinemunde, Stettin, and Stralsund. In 1862, 11,963 vessels, of 2,009,816 tons, entered; and 12,138 vessels, of 1,883,338 tons, left the various Prussian ports. The principal exports are the productions of the soil and the manufactures of the country; the imports are sugar, coffee, tea, spices, cotton, silk, tobacco, dye-stuffs, etc. A great part of the trade of Prussia is carried on overland with Russia and the German States.

Internal Communication.—Prussia possesses a great number of navigable rivers, many of which, like the Elbe, Oder, and Vistula, are connected together by canals. Since 1815 large sums have been expended in the construction and improvement of the roads, and there are now 8320 miles of highways, three-fourths of which have been constructed since 1815. The total length of the railways in operation in 1861 was 3055 miles.

Government, Education, etc.—The government is a hereditary monarchy in the male line. The sovereign exercised absolute power till 1847, when a representative constitution was granted; and in 1848 farther concessions were made, establishing the freedom of the press, the right of public meeting, independence of judges, etc.; but not a few of these have since been virtually recalled. The legislative power is vested in the king and two representative assemblies, the one consisting of princes of the blood-royal, nobles, members named by the king, and members elected by the wealthier classes—in all, about 180; the other of 350 members, elected by universal suffrage. The majority of the people are Calvinists; but the fullest liberty is accorded to the other sects, and Christians of all denominations are equally admissible to public offices. In 1861 there were 11,298,294 Protestants, 6,906,988 Roman Catholics, 254,785 Jews, 16,233 Mennonites, and 13,716 belonging to the Greek Church. The Prussian system of national education is considered the most complete in Europe. Attendance at school is enforced by law on all between the ages of five and fourteen, except they are otherwise receiving instruction. In 1858 there were 24,923 primary schools, with 33,932 teachers and 2,719,072 scholars; 708 middle schools, with 2778 teachers and 96,139 scholars; 101 high town schools, with 911 teachers and 22,940 scholars; 35 preparatory gymnasia, with 226 teachers and 3346 scholars; and 134 gymnasia, with 1875 teachers and 38,700 scholars. Besides these, the universities of Berlin, Bonn, Breslau, Halle, Greifswald, Königsberg, and the Academy of Münster, had 4765 students. The disjointed and naturally defenceless character of the Prussian dominions renders a large military force necessary. Every male subject between the ages of 20 and 25 is obliged to serve for three years in the regular army; from 26 to 32, he belongs to the first ban of the *Landwehr* or militia; and from 32 to 39, to the second ban of the *Landwehr*. The first ban is exercised from two to four weeks annually; the second ban is seldom exercised, and only for a limited period. The *Landstrum*, or levy in mass, consists of all males between 17 and 50 not in the regular army or Landwehr, but this force is only called out in case of invasion. The Prussian army, on the peace footing, consists of about 211,000 men in the regular army, and 4000 in the active Landwehr, besides about 8000 officers. On the war footing the army consists of 255,599 infantry, 37,561 cavalry, 27,918 artillery, and 5500 pioneers; besides a garrison force of 277,889 men. The navy consists of 3 frigates, 3 corvettes, having in all 321 guns. The total revenue for 1863 was estimated at £20,711,623; the expenditure £21,976,623; the public debt being £40,499,578.

Population.—Prussia is divided into 9 provinces, 25 governments, and 335 circles. In 1816 it contained 10,169,899 inhabitants; in 1825, 12,075,657; in 1846, 16,112,948; in 1855, 17,202,013; in 1858, 17,739,913; and in 1861, 18,491,220, as in following table, which also gives the distribution of productive land in the several provinces in English acres:—

Provinces.	Area in Eng. Sq. Miles.	Population in 1861.	Arable.	Wood.	Pasture.	Meadows.	Gardens and Vineyards.
East Prussia .	14,970	2,866,866	6,930,980	2,253,455	1,391,708	1,564,227	204,241

The population of Berlin, the capital, in 1861, was 524,945; of Breslau, 138,651; of Cologne, 113,083; Königsberg, 87,092; Magdeburg, 78,665; Dantzic, 72,280; and Aix-la-chapelle, 58,553.

SWITZERLAND.

Switzerland is an inland country of Europe, surrounded by France, Germany, and Italy, and lying between 45° 50′ and 47° 50′ N. latitude, and 5° 55′ and 10° 30′ E. longitude. It is about 210 miles in length from E. to W., by 140 in breadth, and has an area of about 15,468 English square miles.

Surface, etc.—Switzerland, as is well known, is characterised by the sublime beauty of its scenery. The surface presents every variety of aspect. Mountains, with their summits covered with perpetual snow, look down upon valleys of vineyards and corn-fields; while glaciers, avalanches, cataracts, craggy precipices, and deep chasms, all give variety and beauty to the scene. The country belongs to the region of the central Alps, the St. Gothard forming a centre or nucleus from which lofty ranges of mountains radiate in every direction. The southern portion is the most mountainous, whence the surface slopes gradually towards the north. The Jura mountains extend along the N.W. borders; and between these and the Alps is a large plain from 1500 to 2000 feet above the level of the sea. The valleys, though seldom less than 2000 feet above the level of the sea, are remarkable for fertility and beauty, and form a striking contrast to the rugged heights by which they are surrounded. Several important rivers of Europe, as the Rhine, Rhone, Ticino, and Inn, take their rise in Switzerland, but do not attain any great size within the territory. The principal of its other rivers are the Aar, Thur, and Emmen. The lakes add much to the beauty of the landscape, and in no other country of Europe are they so numerous, with the exception of Sweden. The principal are the Lakes of Geneva, Constance, Lucerne, Brienz, Thun, Neufchatel, Wallenstadt, Zurich, Zug, and portions of Lakes Maggiore and Lugano. Most of these are of large extent, and are traversed by steam-boats. The climate may be said to vary from the cold of Lapland to the heat of Italy or Spain; it is, however, on the whole, more severe than the position of the country would lead one to expect. In Geneva the mean temperature of the year is 52° 7′, of winter 34°, of summer 70°; and the annual fall of rain 29 inches. Some of the deep and narrow valleys are oppressively hot and insalubrious.

Productions.—On account of the differences of climate, the vegetable productions are very various. The fig and the grape ripen at the foot of a mountain whose summit is covered with perpetual snow. The country is more pastoral than agricultural, and cattle, sheep, and goats constitute the chief wealth of the population. There are about 850,000 cattle, 105,000 horses, 470,000 sheep, 347,000 goats, and 320,000 swine in the country. The value of these is estimated at about £6,000,000. The distribution of the land is estimated as follows:—Arable, 11 per cent; forests, 17 per cent; alpine and pasture land, 20 per cent; meadow, 20 per cent; vineyards, 1 per cent; and uncultivated land, water, roads, and dwellings, 31. The quantity of grain produced is not nearly sufficient to meet the wants of the people. The chief agricultural productions are wheat, barley, rye, potatoes, flax, and hemp. The cultivation of the vine is in some parts an important branch of industry. The forests abound with game, and the rivers and lakes supply excellent fish. On the mountains are the ibex and chamois. Switzerland is less rich in mineral productions than might be expected from so mountainous a country. Iron is found in various

parts, and mines of lead, copper, and zinc are wrought in the Jura Mountains. Coal is found in the northern parts, and turf is abundant in the marshy districts.

Manufactures, etc.—Switzerland has recently been progressing in various branches of manufacture. The chief of these are woollen, linen, and cotton goods, silk, leather, watches, and jewellery. The cotton manufacture employs about 90,000 hands; the silk, 60,000; linen, 10,000; watches and jewellery, 30,000; woollens, leather, paper, and tobacco, 10,000. The chief seats of the cotton manufacture are Zurich, Aargau, and St. Gall; of the woollen, Zurich, Glarus, and Solothurn; and of the linen, Bern, Zurich, and St. Gall. The silk manufacture has of late made rapid progress. Zurich is the seat of the broad or garment silk manufacture, and Basle of the narrow or riband branch. There are 8000 or 9000 looms generally at work in Basle, producing ribands to the annual value of £1,500,000. At Zurich the number of looms is probably nearly the same, but the quantity produced is less, as many of the weavers are partly employed in agriculture. Indeed, except in the larger towns, the manufactures of Switzerland are mostly domestic, being engaged in only in winter, or when agricultural or pastoral pursuits do not demand attention. The trade of Switzerland is considerable. In 1862 the import duties amounted to £305,667; export, £16,616; and transit, £1804. The chief exports are woollen, cotton, linen, and silk goods, lace, watches, jewellery, cattle, cheese, and wine; imports—wheat, salt, leather, raw cotton, hemp, flax, and colonial produce. Switzerland also enjoys a large share of the transit trade between Germany and Italy, Austria and France. The roads, which are maintained by the cantonal government, are almost everywhere in good order. In 1860 there were 660 miles of railway in operation.

Population, etc.—The Swiss Confederation consists of twenty-two cantons, which, with their areas and populations in 1860, are as follows:—

Cantons.	Area in English Sq. miles.	Population in 1860.	Cantons.	Area in English Sq. miles.	Population in 1860.
Aargau	487	194,208	Solothurn	253	69,263
Appenzell	150	60,431	St. Gall	751	180,411
Basle	133	92,265	Tessin	1,032	116,343
Bern	2558	467,141	Thurgau	266	90,080
Freyburg	551	105,523	Unterwalden	254	24,902
Geneva	90	82,876	Uri	418	14,741
Glarus	274	33,363	Valais	1,650	90,792
Grisons	2966	90,713	Vaud	1,179	213,157
Lucerne	573	130,504	Zug	84	19,608
Neufchatel	278	87,369	Zurich	683	266,265
Schaffhausen	113	35,500			
Schweitz	335	45,039	Total	15,128	2,510,494

The federal assembly consists of two divisions, a national council and a senate. The national council is composed of 120 members, being one for every 20,000 inhabitants in each canton, elected triennially. The senate consists of forty-four members, two for each canton. The federal assembly chooses from among the citizens eligible to the national council seven members to compose the federal council, which is the ministry of the administration, and is elected for three years. The federal tribunal, also appointed for three years by the federal assembly, consists of eleven members and eleven substitutes, and decides in all civil matters between the cantons. The federal city is Bern. In its internal administration each canton is independent. The federal army is composed—1*st*, Of the regular army (*Bundesauszug*), composed of men from 20 to 34 years of age, in the proportion of three per cent of the population; 2*d*, The reserve, composed of men from 34 to 40 years of age, in the proportion of 1½ per cent of the population; and 3*d*, The Landwehr, which includes all men able to bear arms not in the regular army or reserve under 44 years of age. The regular army consists of 82,280, and the reserve of 47,781 men. The budget for 1862 estimated the income and expenditure at £796,466 and £771,441. About two-thirds of the people are Calvinists, but to all religious sects the greatest liberty is accorded. Education is very generally diffused. There are three universities, at Basle, Bern, and Zurich.

HOLLAND.

Holland, or the Netherlands, a kingdom of Western Europe, is situated along the shores of the German Ocean, between lat. 50° 44′ and 53° 34′ N., and long. 3° 30′ and 7° 10′ E. It is bounded on the N. and W. by the German Ocean, S. by Belgium, and E. by Germany. That portion of Luxemburg which the king of Holland possesses, with the title of Grand Duke, as part of the German Confederation, is not comprised within the above boundaries, being detached from the Dutch dominions, and surrounded by those of Prussia, Belgium, and France. Holland proper comprises the ancient republic of the Seven United Provinces, with certain portions of the duchy of Limburg, and has an area of 12,586 English square miles.

Surface.—Holland forms the W. extremity of the great plain of Europe. Its surface is perfectly flat, with the exception of some low hills that traverse the provinces of Gelderland, Overyssel, and Utrecht. The land has been formed for the most part of the deposits of the rivers which flow through it. These have, as far as possible, been confined by embankments within narrow channels, and numerous canals have been formed to carry off the superfluous waters, and to serve as means of internal communication. The land thus acquired is nowhere much above the level of the sea, and is in many parts considerably below it. Hence, a great part of its coast has to be protected by enormous artificial dykes, formed partly of huge blocks of granite brought from Norway, and partly of mud and clay with wickerwork. The entire cost of the defences against inundation, including dykes, sluices, drawbridges, and hydraulic works of every kind, is estimated at not less than £300,000,000. The principal rivers are the Rhine, Meuse, and Scheldt. The first of these enters Holland at Lobith, a little below Emmerich, where it is 2300 feet broad, and then divides into two branches, the southern one of which, called the Waal, flows westward for about 45 miles, and joins the Meuse near Gorcum. The other branch, which retains the name of Rhine, flows N.W. for 6 miles to Westervoort, where it again divides; one branch, the New Yssel, flows N. for about 65 miles to the Zuyder Zee; the other branch flows W. for about 30 miles to Wyk-by-Durstede, where it again divides. The Lek branch flows westward for 35 miles, and joins the Meuse 7 miles E. of Rotterdam, while the Kromme Rijn flows N.W. to Utrecht, where a fourth division takes place, the right branch, called the Vecht, flowing N.W. to the Zuyder Zee, the left, called the Old Rhine, flowing W. past Leyden to the North Sea. The Meuse, or Maas, enters Holland above Eysden, in Limburg, and after uniting with the Waal, near Gorcum, divides into several branches, forming numerous islands, and eventually falls into the North Sea by several mouths. The Scheldt enters Holland below Antwerp, and divides into two branches, the East and West Scheldt, forming the islands of North and South Beveland and Walcheren. The West Scheldt falls into the Sea at Flushing, the East Scheldt between the islands of North Beveland and Schouwen. The inundations which from time to time have taken place, notwithstanding every precaution, have been the means of forming several extensive lakes. The Haarlem Meer, which has recently been drained, but which formerly had a circumference of thirty-three miles, was formed in this manner in the sixteenth century. The Zuyder Zee, an extensive arm of the sea, occupying an area of about 1200 square miles, was formed by successive inundations in the course of the thirteenth century; and the Dollart was formed in the same manner.

Climate.—The climate of Holland is in winter much colder than that of England, and the waters are frequently frozen over for three months in the year. The mean annual temperature is about 47° Fahr., but it is sometimes as low as 23° below zero, and sometimes as high as 102°. The climate generally is variable, and is very moist, particularly in the western provinces. Strong winds prevail, and tempests are frequent in winter and spring.

Productions.—The most fertile provinces are those of the south. Although much land has been reclaimed of late years, there are still extensive tracts of it remaining uncultivated. In the table of the population will be given the extent of arable and uncultivated lands. In 1859 the produce of the different crops in English bushels was—Wheat, 4,158,260; rye, 6,996,752; barley, 3,248,530; oats, 6,619,406; buck-wheat, 3,131,521; peas, 454,088; beans, 1,835,236; potatoes, 30,931,687; besides which there were 34,809 acres in flax, 74,251 acres in turnips, and 4936 acres in tobacco. In Gelderland there are large plantations of apple, pear, cherry, and other fruit trees. Tulips and hyacinths are extensively cultivated in the neighbourhood of Haarlem in fields of several acres each. Pulse and garden vegetables are everywhere raised in abundance, as also woad and madder. Flax is largly cultivated in the south, especially in the neighbourhood of Dort. The rearing of cattle, however, and dairy husbandry, are more attended to than agriculture. Butter and cheese of the best quality are largely exported. In North and South Holland, Groningen, and Utrecht, about 140,000,000 lbs. of cheese (value £1,800,000) are made annually, of which the home consumption does not exceed one-twentieth. The value of butter annually made is about £2,000,000, of which about one-tenth is consumed in the country. In 1860 there were 243,454 horses, 1,287,538 cattle, 865,728 sheep, 114,903 goats, and 276,586 swine. The soil being almost everywhere alluvial, Holland possesses little, if any, mineral wealth. Some bog-iron is found, but no other metal. Extensive beds of peat, however, are common. Besides its abundant means of communication by rivers and canals, Holland also possesses excellent roads. These often extend for miles along the summits of the dykes, and thus command extensive views. The roads and canals are usually lined with willows and other trees, which afford an agreeable shade, and at the same time improve the landscape. In 1863 there were 266 miles of railway in operation.

Manufactures.—The manufacture of linen and cotton goods is widely extended over the country. The silk manufacture has been long carried on at Haarlem and Amsterdam. The principal seat of the woollen manufacture is Tilburg, where there are sixty-one establishments, employing 3300 persons. Shipbuilding is a considerable branch of industry. The manufacture of bricks and tiles is necessarily of importance in a country where scarcely any stone is to be met with, and hence there are 332 of these establishments. Among its other manufactures are tobacco, earthenware, sugar, gin (324 distilleries), beer, paper, shoes, and machinery. Amsterdam enjoys a monopoly in diamond cutting, which employs about 700 persons. The fisheries of Holland, which were at one time the most important in the world, are now comparatively insignificant.

Commerce.—In the seventeenth century Holland was the great commercial centre of Europe, and it is estimated that at one time nearly one-half of the shipping of Europe belonged to it. Its commerce declined considerably in the early part of the eighteenth century; and from 1794 to 1814, when the country was in the hands of the French, it was totally annihilated. In 1861 the total value of the imports was £39,873,752, and of the exports, £34,095,358. Nearly a fourth of its export and import trade is with great Britain; the exports to Britain (1862) being £7,863,031, the imports £10,641,104. Butter and cheese stand high among its exports; in 1861, 17,761 tons of the former, and 28,513 of the latter were exported. In 1862, 8361 vessels, of 1,695,212 tons, entered, and 4,872, of 1,108,359 tons, left the various ports of the kingdom. The merchant fleet of Holland in 1862 consisted of 2332 vessels of 286,217 tons burden.

Population.—The following table gives the area, in English acres, of each of the provinces of the kingdom, with their distribution as in 1860, and populations in 1862. Luxemburg, which is not included, has an area of 975 square miles, and contained in 1862, 202,313 inhabitants.

Provinces.	Population in 1862.	Total Area.	Arable.	Pasture.	Woods.	Waste.
North Brabant	414,665	1,270,000	286,700	262,000	154,200	378,000
Gelderland	411,947	1,260,000	267,000	358,500	169,500	327,000
South Holland	642,688	750,000	136,000	432,500	37,500	24,750
North Holland	554,221	650,000	74,200	370,700	17,300	74,250
Zealand	172,249	410,000	180,500	163,000	9,200	9,850
Utrecht	165,681	340,000	59,300	175,500	38,000	29,600
Friesland	279,154	800,000	116,100	496,800	19,500	61,900
Overyssel	241,835	680,000	133,200	262,000	36,800	331,200
Groningen	214,425	580,000	207,600	230,000	3,200	74,250
Drenthe	100,506	650,000	69,200	116,100	12,400	247,200
Limburg	218,775	550,000	192,700	101,100	57,800	189,000
Total	3,416,146	7,950,000	1,722,500	2,968,200	555,400	1,747,000

The principal towns, with their populations in 1862, are—Amsterdam, 263,204; Rotterdam, 116,403; Hague, 82,620; Utrecht, 55,541; Leyden, 37,339; Groningen, 36,192.

Government, etc.—The government is a constitutional representative monarchy. The crown is hereditary in the male and female line. The executive power is vested in the king; the legislative in the king and the States-general. The States-general is composed of two chambers, the one consisting of 39 members, elected for

nine years by the several provincial states, the other of 68 members, nominated for four years by 38 electoral districts, each sending one, two, or more members, according to its population. The council of state consists of fourteen members appointed by the king, as are also the ministers or heads of the departments of administration. Each of the provinces has also its legislative and administrative councils, called the provincial states. The established religion is Calvinism, but other religions are tolerated, and state offices are equally open to all. In 1859 there were 1,942,387 Calvinists, 64,539 Lutherans, 1,234,486 Roman Catholics, and 63,890 Jews. There are three universities in Holland, at Leyden, Utrecht, and Groningen, having in all about 1400 students. Besides these, there are numerous primary and infant schools, private boarding-schools, evening and Sunday schools, Latin schools, and gymnasia. About one-seventh of the entire population is at school. The budget for 1861 estimated the national income and expenditure at £7,268,700 and £7,200,000 respectively. The national debt in 1862 amounted to £85,779,715. In that year the Dutch army consisted of 60,962 men and officers; the navy of 145 vessels of all kinds, with 1780 guns.

BELGIUM.

Immediately S. of Holland, and having on the other sides Germany, France, and the North Sea, is the kingdom of Belgium, between lat. 49° 27′ and 51° 30′ N., and long. 2° 34′ and 6° 4′ E. It is somewhat in the form of a triangle, the longest side of which adjoins France. Its greatest length from N.W. to S.E. is 174, and its greatest breadth from N. to S. 105 miles; area, 11,373 English square miles.

Surface.—The surface is generally flat, having few elevations, and these rarely exceeding 2000 feet in height. They are principally to be found in the E. and S.E. parts of the kingdom, the N. and N.W. parts bearing a considerable resemblance to Holland. The provinces of Liege, Luxemburg, and Namur are the most mountainous. In the provinces bordering upon the sea the land is sometimes so low as to require to be protected from inundation by dykes. Some parts along the banks of rivers require to be similarly protected. The principal rivers are the Scheldt, Meuse, and Yzer. The Scheldt flows generally in a S.W. and N.E direction, and is navigable for its entire length in Belgium, about 108 miles. The Meuse has a length in Belgium of 115 miles, for the whole of which it is navigable. The small river Yzer, which falls into the sea at Nieuport, is navigable for 26 miles. The chief affluents of the Scheldt are the Ruppel, formed by the junction of the Dyle and Nethe; the Demer, an affluent of the Dyle; the Dender, Darme, and Lys. The affluents of the Meuse are the Ourthe, with its tributaries the Ambleve and Vesdre, and the Sambre.

Climate and Productions.—The climate is more temperate and salubrious than that of Holland, and is considered to very much resemble that of England. In the S.E. parts the atmosphere is more pure and bracing than in the lower parts towards the N.W., where it is frequently damp and hazy. Frost rarely appears before the middle of October, or lasts longer than the middle of April. The mean annual temperature at Brussels is 50·3° Fahr.; the annual fall of rain 27·9 inches. Agriculture has made rapid progress in Belgium since 1830, and affords employment to about one-fourth of the entire population. About 6,500,000 acres of land are under cultivation, chiefly in small holdings, the majority of which do not exceed two and a half acres in extent. The agriculturists are generally averse to the introduction of improvements, but the land is cultivated with great care, and is very productive. The estimated produce of 1860, in imperial quarters was—Wheat, 2,460,203; rye, 2,170,254; potatoes, 6,823,607. Among its other productions are flax, hemp, hops, tobacco, madder, beet, chicory, peas, beans, and turnips. A considerable part of Belgium is occupied by forests, especially in the provinces of Luxemburg, Namur, and Liege. The rearing of cattle receives a considerable degree of attention in the two Flanders, and in other districts. Belgium is rich in various kinds of minerals, as coal, iron, calamine, lead, etc. The coal-beds occupy an area of about 320,000 acres in the provinces of Hainault, Liege, and Namur, and furnish all the varieties, from anthracite to the richest gas-coal. In 1860, 9,000,000 tons of coal were raised in Belgium, of the total value of more than £4,000,000, and employing upwards of 74,000 persons. The chief iron districts are the arrondissement of Charleroi, and the provinces of Namur, Liege, and Luxemburg. In 1860, 280,000 tons of cast-iron were produced. The other metallic products are calamine, pyrites, blende, and lead. Marble is in many parts abundant; and there are numerous quarries of freestone, limestone, granite, slates, etc.

Manufactures and Commerce.—The manufactures of Belgium are extensive and varied, comprising cast-iron, machinery, fire-arms, nails, cutlery, cotton, woollen, linen, and silk fabrics; gloves, paper, glass, sugar. Upwards of 20,000 persons are employed in the manufacture of fire-arms in Liege and the vicinity. Cutlery is the staple manufacture of Namur; but it has been stationary for some time. The number of spindles employed in the Belgium mills is about 550,000. Lace is one of the most important manufactures of the country, and affords employment to about 125,000 women and girls, chiefly in Flanders, and in the provinces of Brabant and Antwerp. The centre of the woollen manufacture is Verviers. In 1860, 3780 vessels, of 667,287 tons, entered, and 3959, having 694,225 tons, left the various ports of Belgium; and on the 1st January 1861, 116 vessels, of 33,111 tons, belonged to the country. The total value of the exports was £18,800,000, imports £20,640,000. The chief trade is with France, England, Holland, and Germany. Belgium is well provided with means of internal communication. It has 630 miles of river navigation, and 376 miles of canals. The roads are numerous, and in excellant condition. They are of three kinds, those maintained by the state and those by the provinces and communes. There are 3865 miles of the first class. In 1835 the Brussels and Malines Railway was opened, and since that time numerous other lines have been laid down, so that in 1860 there were 1200 miles in operation.

Population, etc.—Belgium is divided into nine provinces,—Antwerp in the N.W. and E.; Flanders and Hainault in the W.; Namur in the S; Luxemburg in the S.E.; Liege and Limburg in the E.; and Brabant in the centre. In 1830 it contained 3,785,814 inhabitants; in 1840, 4,073,162; in 1850, 4,426,202; and in 1861, 4,731,957. At 1st January 1861 Brussels, the capital, contained 174,829 inhabitants. The government is a constitutional representative monarchy. The crown is hereditary in the male line only. The legislative power is vested in the king, the senate, and the house of representatives. The senate consists of 54 members nominated by the people, and holding office for eight years. The house of representatives consists of 108 members elected by the people for four years. Both houses meet annually in the month of November, and sit usually for six weeks. The executive is vested in the king, assisted by six responsible ministers. Each province is under a governor chosen directly by the king, and a provincial council elected by the people. Trial by jury is established; the press is free; and punishment by death abolished. Not only is the fullest liberty accorded to all religious sects, but the ministers of each are paid out of the public treasury. There are about 4,600,000 Roman Catholics, 7600 Protestants, and 1400 Jews. The educational institutions are in a very efficient state, but it is complained that they are not sufficiently taken advantage of, attendance not being compulsory. The schools are open to all, and gratuitous instruction is provided for all those who may not otherwise have the means of acquiring it. There are four universities, of Ghent, Liege, Brussels, and Lorraine. The budget of 1862 estimates the revenue and expenditure at £6,128,579 and £5,807,055 respectively. The national debt amounted in 1862 to 29,544,300. The army consists of 56,550 infantry, 8202 cavalry and gendarmerie, 6700 artillery, and 2266 engineers, etc.; in all, 73,718 men and 10,690 horses. The navy is insignificant, consisting only of two or three small ships.

DENMARK.

The Danish kingdom (exclusive of the duchies of Schleswig, Holstein, and Lauenburg, which now belong to Germany) comprehends the peninsula of Jutland, the islands of Zeeland, Fühnen, Laaland, and about 200 larger and smaller adjacent islands in the North Sea and the Baltic. The coasts are deeply indented by innumerable gulfs, bays, and inlets. Denmark lies between N. lat. 54° 35″ and 57° 44′ 52″, and with the exception of the island of Bornholm, which is between E. long. 14° 42′ and 15° 10′, between E. long. 7° 37′ 22″ and 12° 34′. The peninsula of Jutland is about 180 miles in length by about 80 in breadth, and has an area of 9667 square miles. Its surface is almost perfectly flat, none of its elevations much exceeding 500 feet above the level of the sea. The soil is mostly of a barren and sandy nature, and much damage is frequently done to the cultivated districts by the sand when carried about by high winds. A considerable portion of it is covered with wood. The pastures are extensive, and large numbers of cattle are reared. Along the western coast, however, where the coast is low and has in many parts to be protected from inundation, as in Holland, by dykes, the surface is generally marshy; but where cultivated is of great fertility, producing abundant crops of wheat, oats, barley, rye, etc. The largest of the Danish islands is Zeeland, which, with some small adjacent islands, has an area of 2700 square miles. Copenhagen, the capital, stands on its E. coast, and it is also the chief seat of the manufactures. The soil is well wooded and fertile; and agriculture and cattle-rearing are largely carried on. Fühnen, the next in size of the islands, has an area of 1270 square miles. Its surface is undulating, and the soil very productive. Laaland has an area of 450, and Bornholm of 220 square miles. The climate of Denmark very much resembles that of Scotland, but is more humid. At Copenhagen the mean temperature of the year is 47·9°—of summer 62°, of winter 32°.

Productions.—Agriculture has of late years been making great progress in Denmark, and large tracts are being annually brought into cultivation. The chief of the agricultural productions are oats, barley, rye, wheat, potatoes, rape-seed, hemp, flax, hops, and tobacco. The rearing of horses and cattle is an object of great attention. The fisheries are extensively prosecuted along the coasts. The mineral resources of Denmark are inconsiderable. Iron-ore is found in small quantity in one or two places, but there are no mines either of it or any other metal. The only minerals of importance are coals, freestone, salt, and porcelain and other clays; but with the exception of the last, even these are not of great extent. Peat is everywhere abundant.

Manufactures and Commerce.—Denmark is not naturally fitted for being a great manufacturing country, and hence this branch of industry does not generally receive a great share of attention. There are numerous porcelain, glass, and brick and tile works, and a number of iron-works have recently been established, the raw material being imported from England. The woollen, linen, and cotton manufactures are for the most part domestic, and for home use. The other manufactures are silk, leather, sugar, tobacco, brandy, beer, paper, etc. The chief articles of export are grain, cattle, butter, cheese, horses, brandy, beer, hides, and fish; of import, sugar, coffee, tea, wine, salt, cotton, wool, coals, timber, and iron. In 1859 the total imports amounted to £6,639,103, of which £2,591,195 belonged to the duchies; the exports to £4,440,551, £2,302,174 being from the duchies. At 1st January 1861 Denmark possessed 5653 vessels, of 123,169 tons, of which 2883 vessels, of 53,673 tons, belonged to the duchies. With the exception of the government roads established between all the principal places, the roads are generally in a bad condition. The first railway was opened in 1847, and there are now about 200 miles in operation.

Population, etc.—In 1840 Denmark contained 2,131,988 inhabitants; in 1850, 2,296,597; and in 1860, 2,605,024. Of this last, Denmark proper contained 1,600,551; Schleswig, 409,907; Holstein, 544,419; and Lauenburg, 50,147. The chief towns, with their populations, were—Copenhagen, 155,143; Altona, 45,524; Flensburg, 19,682; Kiel, 17,541; Odense, 14,255. The government was an absolute hereditary monarchy, but since 1834 a national representative council has been appointed. The kingdom was then divided into four political provinces—the Danish Islands, Jutland, Schleswig, and Holstein—each of which had its own provincial assembly. The national council was composed of 60 members, 15 nominated by the king, the remainder by the provincial assembly, the nobility, and clergy. As Duke of Holstein and Lauenburg, the king was a member of the German Confederation, and had three votes in the General Assembly, and the tenth place in the Representation. The established religion is Lutheran, but civil rights and privileges are equally enjoyed by members of other sects, the number of whom, however, is very small. The affairs of the church are administered by eight bishops appointed by the crown. A system of national education is established, and attendance at school is compulsory on all between the ages of seven and fourteen not otherwise receiving instruction. Free education is afforded to those whose parents are unable to pay for it. The nominal strength of the Danish army on the peace footing is about 25,000 men, but during the war with Austria and Prussia in 1863-64 there were in the field 49,300 infantry, 10,600 cavalry, and 9000 artillery, with 144 guns. The navy in 1862 consisted of 4 ships of the line, 9 frigates, 7 corvettes, and 75 other vessels, having in all 1144 guns. The revenue

and expenditure for the year ending 31st March 1861 were £2,871,621 and £2,840,671 respectively. In 1856 the national debt amounted to £10,856,903.

NORWAY.

A country of northern Europe, forming the western portion of the Scandinavian peninsula, and extending from lat. 58° to 71° N., and long. 5° to 31° E. It is bounded on the N. by the Arctic Ocean, E. by Russian Lapland and Sweden, S. by the Skager Rack, and W. by the German Ocean. It is about 1100 miles in length from N. to S., but varies greatly in breadth, from 250 to less than 20 miles. Area, 122,911 English square miles.

Surface and Climate.—The coast of Norway is characterised by the irregularities of its outline, caused by the depth of its inlets or fiords, the boldness of its headlands, and the multitude of its islands, often almost undistinguishable from the mainland. The interior is almost one immense mass of rocky mountains and plateaux. The mountains of Norway do not form continuous chains or ridges, neither are they a series of detached elevations; but, especially in the S., they form plateaux or table-lands of great breadth, generally more or less connected together, though occasionally separated by deep valleys. These table-lands are the *Fjelds* of Norway, and are usually distinguished by specific names. North of Trondhjem, in lat. 63°, the country becomes very narrow, and the mountains assume more of the form of a ridge, termed the Kiölen. The highest part of this range is the mass called the Sulitelma, some of the summits of which exceed 6000 feet in height. South of Trondhjem about 40 per cent of the land is more than 3000 feet above the sea, and one point, the Skageslöestinden, rises to the height of more than 8000 feet. The rivers of Norway all rise at a great elevation, and as their courses are generally short, they present numerous magnificent waterfalls. They are of little use in navigation, but are largely employed in driving machinery and in floating down timber; while in winter, being covered with strong ice, they constitute the chief means of communication. The longest is the Glommen, which has a course of about 250 miles. The lakes of Norway are numerous, especially in the southern districts. Many of them are at a great height, and all of them are very deep, and abound in fish. The climate is on an average superior to that of any other continental country in the same latitude, and on the whole is less visited by extremes of heat and cold. This is chiefly owing to the influence of the Gulf Stream, which strikes on this coast. Hence it is that the smallest piece of drift ice is unknown on any part of the coast; and hence the harbour of Bergen is not frozen oftener than the Seine at Paris—that is two or three times in a century. In the interior the climate is much more severe than on the coast. The mean temperature of the year at Christiania is 42°, being 25° in winter and 60° in summer.

Productions.—The proportion of arable land to the whole of Norway is not more than 1 to 10, and if we exclude a few local enlargements of the plains near the capitals, it would not exceed 1 in 100. The principal crops are barley and rye, and next to them oats, flax, hemp, and potatoes. The corn raised does not nearly equal the home consumption. The forests of Norway constitute its principal wealth. These are of great extent, and comprise fir, pine, oak, elm, birch, and other trees. In the mountain districts the rearing of cattle constitutes the chief occupation of the inhabitants. The cattle and horses are small in size, but the latter are strong and hardy, and are largely exported. Goats are very numerous, but sheep are rare and of an inferior breed. The inhabitants along the coast are chiefly dependent on the fisheries. Sea-fowl are also abundant along the coast; and in the north the rein-deer forms the principal means of subsistence to the inhabitants. The chief mineral productions are iron, copper, silver, lead, cobalt, and arsenic.

Manufactures and Commerce.—There are few manufactures in Norway, and these are chiefly domestic—the farmers and country people spinning their own flax and wool, and weaving their own linen and woollen cloths. In the larger towns there are some woollen, linen, and cotton manufactories. Saw-mills and distilleries are numerous; and ship and boat building is carried on in most of the towns along the coast. The chief articles of export are fish and timber. The chief imports are grain, sugar, coffee, tobacco, cotton (raw and manufactured), hemp, wine, and spirits. In 1859, 10,379 vessels, of 467,518 tons, entered, and 10,600 vessels, of 491,169 tons, left the various ports of Norway.

Population, etc.—Norway is subdivided into 17 districts, and contained in 1845, 1,328,471, in 1855, 1,433,488, and in 1861, 1,600,000 inhabitants. The principal towns, with their populations, are—Christiania, 40,000; Bergen, 26,000, and Trondhjem, 16,500. The religion of the state is Lutheran, but other sects are tolerated, with the exception of Jews and Jesuits. There are 5 stifts, each of which has a bishop, and 340 parishes. The press is free, and education is widely diffused among all classes. Primary schools are established in all the towns and villages, and most of the towns have also superior burgh schools. There is an excellent university at Christiania. About one-seventh of the population are receiving education at the schools. Though Norway be united to the crown of Sweden, its government is quite distinct from that of the latter country. The government of Norway is a hereditary monarchy, with a representative assembly. The members of this assembly, or *Storthing*, are elected by electors chosen by the people, in the ratio of one for every 50 citizens in the towns, and one for every 100 citizens in the rural districts. These electors then choose from 75 to 100 representatives to compose the Storthing. It meets once in three years, and cannot sit longer than three months. It divides itself into two houses—one, the *Lagthing*, or upper house, is composed of one-fourth of the whole members, chosen by the assembly; while the remainder form the *Odelsthing*, or lower house. The executive power is vested in the king. The ministry, or council of state, is composed of the viceroy, the minister, and the councillors of state. The minister of state and two councillors remain with the king at Stockholm, the rest compose the regency at Christiania. The annual revenue and expenditure are each estimated by the budget of 1860-63 at £469,953. The public debt in 1860 was £956,475. The army consists of 25,545 men, of whom 15,978 are infantry, 1382 cavalry, 2151 artillery, and 15,607 national guards. The navy in 1860 comprised 146 vessels, carrying in all about 854 guns.

SWEDEN.

Sweden occupies the eastern and larger portion of the Scandinavian peninsula, and is situated between 55° 20′ and 69° N. lat., and 11° and 24° E. long. It is bounded on the N. by Norway and Russia; W. by Norway, the Cattegat, and the Sound; S. by the Baltic; and E. by the Baltic, the Gulf of Bothnia, and Russia. It is about 900 miles in length from N. to S., and generally from 150 to 200 miles in breadth. Area 169,655 English square miles.

Surface and Climate.—The surface is remarkably flat, except along the western frontier, where the Scandinavian Alps separate it from Norway. These have a general elevation of from 3000 to 6000 feet, and thence the country slopes gradually towards the E., forming in its descent two extensive table-lands, the one being generally about 2000, and the other about 800 feet above the level of the sea. The southern portion consists chiefly of vast sandy plains interspersed with numerous lakes. Though there are considerable exceptions, the coast generally is low and sandy, indented with numerous bays and inlets, and skirted by an immense number of islands. The country is extremely well watered by rivers and streams, almost all of which, however, are of small size. The longest is the Tornea, 290 miles in length, separating Sweden from Russia. The Angerman, Umea, and Windel have each a length of about 240 miles. The lakes of Sweden are very numerous, and are estimated to occupy one-eighth of the entire area of the kingdom. The principal of these are the Wener, Wetter, Maelar, and Hielmar. The climate is on the whole milder than might be expected from its high latitude. In the south it resembles that of northern Germany, but in the northern parts snow and ice last for six months in the year. At Stockholm the mean temperature of the year is 42°, of winter 25·8°, and of summer 60·4°.

Productions.—The soil is not generally fertile, and the unsettled nature of the climate frequently produces a failure of the crops. The principal crops are wheat, rye, barley, oats, buckwheat, peas, beans, potatoes, hemp, flax, tobacco, and hops. Formerly the corn produced did not nearly meet the home consumption, but from the great improvements that have recently taken place in agriculture, the general introduction of the potato, and the decrease of the quantity of grain used in distillation, the produce is not only equal to the consumption, but yields a considerable surplus for exportation, amounting in 1860 to 10,849,506 cubic feet. About one-fourth of the surface is covered with forests, but the produce of timber is not great, the trees being generally small and sparsely set. They are much used for fuel. The principal are the pine, fir, birch, lime, ash, elm, and oak. The pine-tree furnishes tar and pitch. Considerable numbers of horses, cattle, and sheep are reared, but they are all of small size, and the wool of the sheep is very coarse. In the northern districts the reindeer is the chief support of the inhabitants. Game and wild animals are common, and fish abound on the coast. Sweden is rich in minerals, especially iron, which is found almost everywhere except in the plains of the south. The iron ore raised during 1860 amounted to 425,000 tons; and the quantity manufactured during the same period was nearly 185,000 tons of pig-iron and about 160,000 tons of bar-iron. Till very lately no pig-iron was allowed to be exported, and the exportation of the ore is still prohibited. Copper is also abundant in various parts; the richest mines are at Fahlun. Lead and cobalt are found, but only in a few places. Silver is also obtained to a small extent; and gold, though found, is not wrought.

Manufactures and Commerce.—The total value of the manufactured goods in 1860 was £3,839,400; there being that year 2509 factories, employing 30,757 persons. Woollen, linen, and cotton stuffs are largely manufactured, weaving being very generally carried on by the peasantry in their own houses. Leather, paper, tobacco, sugar, glass, earthenware, cast-iron, beer and brandy, are among the chief of its other manufactures. A large decrease in the quantity of brandy distilled has recently taken place in consequence of a rise in the rate of duty. In 1835 there were 85,172 small and 670 large distilleries, whereas in 1860 there were only 2824 small and 353 large distilleries. In the latter year 8,451,500 gallons of brandy were made, on which a duty of about £400,000 was paid. Ship and boat building is carried on to some extent at most of the ports. The merchant fleet of Sweden in 1860 consisted of 3200 vessels, with an aggregate burden of about 308,684 tons. In 1860, 5480 vessels, of 239,239 tons, entered, and 7340 vessels, of 497,919 tons, left the various ports of Sweden; the value of the imports being £4,581,600, of the exports £4,805,000. A great portion of the internal trade of Sweden is carried on coastwise, there being few provinces that are not washed by the sea. The large inland lakes are of great use in this respect. There are several canals, the chief of which is the Göta, which, by means of the river of that name, and the lakes Wener and Wetter, connects the Baltic with the Cattegat. There are good roads between all the principal towns, and in the winter season sledges are much used for the conveyance of goods.

Population, etc.—Sweden comprises three large divisions—Gothland in the S., Sweden proper in the centre, and Norland in the N., which are subdivided into 24 læns or provinces. The population in 1800 was 2,347,303; in 1822, 2,645,265; in 1855, 3,639,332; and in 1861, 3,859,728. Stockholm, the capital, contained in 1860, 121,737 inhabitants. The government is a constitutional monarchy, hereditary in the male line, with a representative diet, composed of four chambers of deputies from the nobility, clergy, burghers, and peasantry respectively. The diet is convened every five years, and usually sits for three or four months. The head of every noble family (of which there are about 2300) is by law a member of the chamber of nobles, but usually only four or five hundred attend. The ecclesiastical chamber consists of about 60 deputies from the various dioceses, besides the 12 bishops and the Archbishop of Upsala, who is president. The burgher chamber consists of 97 representatives, and the peasant of 144. The king has a veto on the decrees of the diet, but has no controlling power over their deliberations. He has the right to introduce measures for their consideration, but can impose no new taxes nor contract loans without their sanction. The people are almost all Lutherans, there being only about 2000 Roman Catholics and 1000 Jews. Toleration is accorded to all, but only Lutherans are admitted to state offices. Education is very generally diffused, and it is stated that there is not one person in a thousand that cannot read and write. Owing to the sparseness of the population, many districts have only ambulatory schoolmasters, or masters remaining for only a few months in the year. There are two universities, at Upsala and Lund, attended by about 1700 students; besides which there are about 145,000 receiving education at the parish schools, 126,000 at ambulating schools, and 130,000 at home. The Swedish army consists of 144,013 men, exclusive of officers, as follows:—1. The *Vaerfvade*, 7692 men voluntarily enlisted for six years; 2. The Gothland militia, 7621, who serve only in that island; 3. The *Indelta*, 33,405, a kind of militia who are called out about four weeks annually, and receive a house, land, and a small annual payment in money or kind; and 4. Troops raised by subscription,

95,295, every male between 20 and 25 years of age being bound to serve. The navy of 1862 consisted of 8 ships of the line, 6 frigates, 7 corvettes, 4 brigs, 18 schooners, 88 gun-boats, besides numerous smaller vessels. The state revenue for 1861-64 is estimated at £1,609,527 yearly; and the expenditure at £1,495,095. The national debt in 1862 amounted to £2,473,559.

RUSSIA.

This extensive country, which comprehends approaching to two-thirds of the entire area of the continent of Europe, extends (including the Trans-Caucasian provinces, which, though in Asia, are usually included in European Russia) from 38° 20′ to 70° N. lat., and from 17° 40′ to 60° 20′ E. long. It is bounded on the N. by the Arctic Ocean; E. by the Ural Mountains, the Ural river, and the Caspian; S. by Asiatic Turkey, Persia, and the Black Sea; and W. by Turkey, Austria, Prussia, the Baltic, Sweden, and Norway. THE RUSSIAN EMPIRE includes large portions of Asia and North America, and has an area of 7,957,000 square miles, or not far from one-sixth of the entire land area of the globe.

Surface and Climate.—The surface of European Russia is one vast plain from the Ural to the Caucasian Mountains. In all this vast region there is scarcely a height that can properly be called a mountain. The Valdai Hills, which form a table-land in the governments of Novgorod and Twer, have an average elevation of about 900 feet, and the highest summit does not exceed 1100 feet above the level of the sea. There is a gradual rise in the land towards the Baltic, so that the provinces on that sea have a mean elevation of about 1000 feet. The Ural Mountains are of no great elevation. Their average height is only about 1000 feet, while their loftiest summit does not exceed 5400 feet above the level of the sea. They are, however, of great breadth, and extend through eighteen degrees of latitude. The Caucasian chain, in the S., extends in a N.N.W. and S.S.E. direction, between the Black Sea and the Caspian. It is about 700 miles in length, and from 65 to 150 in breadth. Mount Elburz, the highest peak, is about 17,800 feet above the level of the sea. A great portion of the surface, especially in the S.E., is occupied by immense deserts, called *Steppes*, generally either destitute of vegetation or scantily covered with grass. The vast region of the *tundras*, extending from N. lat. 64° to the N. coast, is a swamp in summer, and is covered with ice for nine months in the year. The country is watered by numerous rivers, several of them being the largest in Europe. The principal are the Ural, Volga, Kuma, Terek, Kur, and Aras, falling into the Caspian; the Don, into the sea of Azoff; the Kuban, Dnieper, Bug, and Dniester, into the Black Sea; the Vistula, Niemen, Narva, Neva, Ulea, Kemi, and Tornea, into the Baltic; and the Onega, Dwina, Mezen, and Petchora, into the White Sea and the Arctic Ocean. The more important of these have already been noticed under EUROPE. Russia contains a large number of fresh and salt water lakes, chiefly in the N. and N.W. The chief of these are Lakes Ladoga and Onega, the former having an area of 6190, the latter of 3500 square miles. Finland, in particular, contains an immense number of lakes; and a number of salt-water or brackish lakes exist in the steppes in the S.E. From its vast extent, Russia possesses a great variety of climate. It is much colder than that of any other European country in the same latitudes, and becomes rapidly colder as we proceed eastward. Archangel, in lat. 64° 32′ N., has a mean annual temperature of 33° Fahr.—in summer 58°, in winter 12°; St. Petersburg, in lat. 59° 56′, mean annual temperature 39°—in winter 18°, in summer 61°; Moscow, in lat. 55° 45′, mean annual temperature 40°—in winter 15°, in summer 65°; Tiflis, in 41° 40′, mean annual temperature 55°—in winter 35°, in summer 55°.

Productions.—With such an extent of soil, and such a variety of climate, the vegetable productions must necessarily be very various. A large portion of the surface is covered with forests, which yield excellent building timber, as well as tar, pitch, and potash, for exportation. Barley, oats, and rye are the principal grains of the northern provinces, while in the middle and southern wheat is raised in great abundance. In the south, maize, tobacco, and the vine are cultivated. Hemp and flax are extensively raised. The total grain produce of Russia (exclusive of Finland, Poland, and Trans-Caucasus) is estimated at 67,400,000 qrs. of wheat and rye, and 97,800,000 qrs. of other kinds of grain; besides 12,700,000 qrs. of potatoes. There are likewise 17,400,000 horses, 21,200,000 cattle, 35,240,000 sheep, 8,860,000 swine, and 1,055,000 goats. Wild animals are numerous, including the bear, wild boar, elk, reindeer, and deer. Camels are much used in the south for crossing the arid steppes in that region. The mineral resources of Russia are very great, especially in the precious metals. The most extensive mines are in the Ural Mountains, especially in the government of Perm, where there are valuable copper and iron mines. In Asia the Altai Mountains and the Nertchinsk Hills furnish a large amount of the mineral productions of Russia. The chief productions are gold, silver, platinum, copper, lead, iron. Though many of the mines are worked by government, the majority of them are in the hands of private individuals. Rock-salt is found in various parts, and brine springs occur in the S. Coal is found only in the southern provinces, and in no great quantity.

Manufactures and Commerce.—Manufacturing industry has of late years been much extended in certain parts of Russia. The manufactures are mostly carried on in Central Russia—in Moscow, Tula, and the surrounding governments. The chief of these are woollen, linen, cotton and silk stuffs, metallic wares, leather, tallow, soap, and sugar from the beet-root. This last has made great progress of late years, being protected by heavy duties on the importation of colonial sugar. At St. Petersburg, glass, porcelain, jewellery, tapestry, etc., are manufactured. Russia derives great advantage commercially from her large navigable rivers and canals, by means of which the White Sea and the Baltic are in direct communication with the Black Sea and the Caspian. There are about 2000 miles of railway in operation, the principal lines being the St. Petersburg and Moscow, the St. Petersburg and Warsaw, the St. Petersburg and Sarskoe-Selo, and the Warsaw and Cracow lines. The internal trade of Russia is chiefly carried on by fairs, held periodically in different parts of the empire. The principal trading ports of Russia are—Archangel, on the White Sea; Riga, Cronstadt, and St. Petersburg, on the Baltic; Odessa, on the Black Sea; and Astrakhan, on the Caspian. The chief exports are tallow, hides, timber, corn, flax, hemp, cattle, oil, and metals: imports—cotton, wine, silk, rice sugar, tea, coffee, dyes, machinery, etc. In 1858 the total value of the exports was £22,676,347; of the imports, £22,407,592. The number of vessels that entered its various ports in that year was 8941, of 1,776,184 tons; that left, 9076, of 1,840,222 tons.

Population, etc.—In 1838 Russia contained 54,752,791 inhabitants, and in 1858, 68,479,128, as in following table, which gives also the distribution of the soil of the larger divisions in English square miles:—

DISTRICTS.	Area in English Sq. Miles.	Population in 1858.	Arable.	Wood.	Meadow.	Waste.
Great Russia	888,088	21,219,651	123,307	345,302	38,433	361,276
Astrakhan	326,478	4,712,525	20,374	51,850	43,258	224,284
Kazan	235,740	8,432,394	49,723	139,805	22,359	9,683
South Russia	170,177	4,775,953	8,649	630	15,652	59,392
West Russia	162,695	8,675,930	63,444	57,747	18,000	15,865
Finland	145,890	1,724,193	...	...	...	...
Trans-Caucasus	80,701	3,492,894	...	...	...	...
Little Russia	80,682	6,817,881	39,360	11,808	13,876	12,630
Baltic Russia	57,435	2,837,328	7,101	21,724	5,403	18,719
Poland	49,408	4,790,379	...	...	...	...
Total	2,161,294	68,479,128	311,958	628,866	157,081	701,849

These districts are subdivided into seventy governments. The populations of the more important towns were—St. Petersburg, 520,131; Moscow, 386,370; Odessa, 104,169; Riga, 72,136. The government is an absolute monarchy, in the hands of the Czar or Emperor, who is also the head of the Church. His authority is subject to no control, except in so far as he may yield obedience to established customs. Public business is carried on under the emperor by certain boards of administration. The inhabitants are divided into four classes: the nobles, clergy, merchants and burghers, and peasants. Several of these classes enjoy certain privileges and immunities. Toleration is extended to all religious sects, but the court and the great body of the people belong to the Orthodox Greek Church. In the Polish provinces a great part of the people are Roman Catholics, and Lutheranism is generally professed in the Baltic provinces. In the S.E. many of the inhabitants are Mohammedans, and even pagans. Jews are numerous, especially in Poland. Russia has six universities, and a large number of institutions for middle, primary, and special instruction. The revenue and expenditure in 1862 amounted respectively to £44,379,275 and £46,592,960. The total debt at 1st January 1860 was £139,397,804. The Russian army consists of regular and irregular troops or Cossacks. The regular army on the war footing amounts to 942,229 men, and the Cossacks to 183,785 men; besides regular troops employed in certain localities, amounting to about 144,418 men, and a reserve of 503,335 men, consisting of veterans and invalid soldiers of the infantry, cavalry, artillery, and engineers. The navy consists of 18 ships of the line, 25 frigates, and 25 corvettes, besides a number of smaller vessels; amounting in all to 310, with 3691 guns. It is divided into the Baltic, Black Sea, and Pacific Ocean fleets.

TURKEY.

A country of southern Europe, lying between 39° and 48° 20′ N. lat., and 15° 30′ and 29° 30′ E. long., and bounded on the N. by Russia and Austria; W. by Austria, the Adriatic, and the Ionian Sea; S. by Greece, the Archipelago, and the Sea of Marmora; and E. by the Black Sea. Its greatest length from E. to W. is about 700 miles, and its greatest breadth about 650. Area, including the dependencies of Moldavia, Wallachia, and Servia, 202,852 square miles. The OTTOMAN EMPIRE comprises, besides Turkey in Europe, a large portion of western Asia, and, at least nominally, Egypt, Nubia, Tripoli, Fez, and Tunis, in Africa; having in all an area of about 1,823,000 square miles, and a population of nearly 37,000,000.

Surface and Climate.—European Turkey in its central, southern, and western parts is traversed in various directions by mountain-chains, generally of no great elevation, but forming numerous valleys and table-lands. The chief of these is the Balkan range, which traverses the country from E. to W. It has a general elevation of from 4000 to 5000 feet; and Mount Scardus, its loftiest peak, attains a height of 9700 feet. Few of the other mountains in Turkey rise to the height of 8000 feet. The chief of the other chains are the Little Balkan range, the Despoto Dagh, the Pindus range, the Kandair Mountains, and Dinaric Alps. In the N. the Carpathian Mountains form, for a great extent, its boundary on the side of Austria. Between the Carpathians and the Balkan range, including also Moldavia, the country belongs to the great basin of the Danube, and is for the most part low and flat. The coasts are generally bold and rocky; that on the Archipelago is deeply indented by bays and gulfs. The country is watered by numerous rivers, the chief of which is the Danube, with its affluents the Save, Morava, Aluta, Sereth, and Pruth. The principal river of the S. is the Maritza, which falls into the Grecian Archipelago. The Turks possess a number of islands in the Archipelago, as well as the island of Candia or Crete in the Mediterranean, S. of Greece. It is about 160 miles in length by 36 in breadth, and is mostly covered with rugged and barren mountains. There are numerous lakes, but they are almost all of small size. The largest are those of Ochrida (about 20 miles by 8), Scutari, and Yanina. The climate of Turkey, from the nature of the country, necessarily varies much in different parts, but is in general much colder than that of Spain or Italy, under the same latitudes. In the Danubian provinces the heat of summer is extreme, while in winter the country is covered with snow and ice, so that travelling is performed by sledges. The higher mountains are covered with snow for six months in the year. The valleys in the S. and W., being protected from the cold N.E. winds by mountain-chains, enjoy a delicious climate; but the maritime lowlands are extremely hot. Destructive storms are frequent in the S., and Albania is subject to severe earthquakes.

Productions.—A great part of the surface is covered with timber. In Croatia, Bosnia, and the neighbouring provinces, the mountains are covered with forests of oak, elm, pine, and fir; and S. of the Balkan extensive forests of sycamore, carob, and plane trees occur. Only a small portion of the surface is cultivated, and agriculture is conducted in a very rude manner; yet the country produces not only sufficient grain for home consumption, but yields also a considerable surplus for exportation. The principal grain crop is maize; but wheat, rye, barley, oats, and buckwheat are very generally cultivated, and millet is grown in the more sheltered places. Rice is produced in the marshy districts of the S. The olive flourishes only in the southern provinces, but the vine is found in most districts. Oranges, figs, citrons, lemons, pomegranates, and other southern fruits come to per-

fection. Flax, hemp, sesamum, saffron, cotton, tobacco, and madder, are the chief of the remaining articles of culture. Sheep and goats are abundant in all parts of Turkey, and cattle in Wallachia, Servia, and Bosnia. Oxen are everywhere employed in field labour, and buffaloes are common in Bulgaria, Rumilia, and other parts. Swine are reared in vast numbers in Servia, Bosnia, and Croatia. The horse is small but active; mules are numerous in Montenegro and the other mountainous parts of Turkey; and the ass is much used in Rumilia and the southern provinces. Among the wild animals are bears, wolves, jackals, wild boars, hares, and other species of game. Fish is plentiful in the rivers; and leeches abound in the marshes, forming an important article of export. The minerals of Turkey are copper, lead, iron, coal, salt, nitre, etc., but the mines are almost entirely neglected. Excellent marble is found in various parts.

Manufactures and Commerce.—The manufactures are almost entirely domestic, but they display greater excellence than might have been expected in a country so far behind in other respects. The leather, silk, carpets, and embroidery of Turkey are celebrated, and constitute important articles of export. Besides these, the chief manufactures are cotton, woollen, and linen stuffs, cutlery, fire-arms, gunpowder, and saddlery. Dyeing and cotton-printing is carried on in different localities. The commerce is chiefly in the hands of Greeks, Armenians, and Jews. The principal imports are linen, woollen, cotton, and silk goods, colonial products, dye-stuffs, hardware, earthenware, and paper. Its chief exports are the productions of its soil. We have no means of estimating the value of the exports and imports; but in 1861 the declared real value of the exports from Turkey into the United Kingdom was £3,631,929, and of the imports £3,104,029. The roads of Turkey are in a wretched condition; and though several railways have been projected, there are none yet in operation.

Population, etc.—Turkey in Europe, including the dependencies of Moldavia, Wallachia, and Servia, had in 1844 an estimated population of 15,730,000. It is divided into 15 *eyalets*, or general governments, each of which is under a *Vali*, or pasha; and subdivided into 43 *livas*, or provinces, governed by *kaimakans*. The livas comprise 376 *cazas*, or districts. The Sultan, who is the chief of the Mohammedan religion as well as sovereign, possesses absolute power, but must at the same time govern according to the principles laid down in the Koran, and as explained by the *Mufti* and the assembly of the *Ulema*, or wise men. The Mufti is at the head of the religious administration, and must always be consulted by the Sultan before undertaking anything of importance. The assembly of the Ulema is composed of theologians and jurists summoned by the Mufti to aid him with their advice. The Sultan is assisted in the government by a cabinet council, or *Divan*, composed of the Mufti and the principal ministers of the state, and presided over by the Grand Vizier, who is at the head of the civil administration. The court of the Sultan is usually called the *Sublime Porte*. Mohammedanism is the established religion of the country, but, with some restrictions, other sects are tolerated; and, indeed, the adherents of other sects in European Turkey outnumber the Mohammedans. *Medressas*, or colleges, are attached to most of the principal mosques; and public schools are established in all the larger towns, but the instruction imparted is of little practical value. The revenue for 1860 amounted to £9,711,608, and the expenditure to £11,088,583. The public debt in 1860 was £40,849,220. The effective force of the army amounts to about 126,000 men, besides a reserve force of about the same number. The navy in 1859 consisted of 64 vesssls, manned by 34,000 sailors and 4000 marines.

GREECE.

Greece lies immediately S. of Turkey, and is bounded on the other sides by the Mediterranean and the Archipelago. It extends from 36° 10′ to 39° 10′ N. lat., and from 20° 42′ to 24° 35′ E. long. Its length, from Cape Matapan to its northern boundary, is 170 miles, and its breadth, from Cape Clarenza to the coast near Marathon, 150 miles. Area, including the Ionian Islands, 20,021 square miles. Continental Greece is naturally divided into two principal parts, the northern comprising Hellas, or Greece proper, the southern the Morea, or Peloponnesus. These two portions are connected by the Isthmus of Corinth, where narrowest only about six miles across. A third part of the kingdom of Greece is its numerous islands, the largest of which is Eubœa, or Negropont.

Surface and Climate.—The coasts are elevated, irregular, and deeply indented; and the surface is almost entirely occupied by mountains and valleys. What plains occur are chiefly along the shores or near the mouths of rivers, or else are mere basins inclosed on all sides by mountains. Mountains, rivers, and lakes occupy more than one-third of the entire area. The principal mountain-chain is the Pindus, which extends from N.W. to S.E. through Hellas to the Isthmus of Corinth, and sends off in its course numerous branches. Mount Guiona, the culminating point of Greece, is 8239 feet in height. A chain passes through the isthmus, and traverses the greater part of the Morea, giving off branches which proceed to the four S. promontories of the peninsula. Greece is watered by numerous streams, but they are mostly short, rapid, and unfit for navigation. The only lake of importance is the Topolias, the ancient *Copais*, in W. Bœotia. In summer it is reduced to a mere swamp, but in winter it is sometimes 15 miles long by 10 broad. The climate is temperate and for the most part healthy, except in the vicinity of lakes or low marshy tracts. At the S. extremity the mean annual temperature is 65·3°, at the Isthmus of Corinth 64°, and at the N. extremity about 62°; but of course in a country with so irregular a surface the climate must vary greatly. The summits of the loftiest mountains are covered with snow from October to the end of March, and even in the plains the snow is occasionally six inches deep, but it never lies long.

Productions.—Probably not more than two-fifths of the entire area of Greece is fit for cultivation. The principal products are wheat, barley, maize, currants, figs, vallonea, tobacco, wine, oil, and cocoons. The currant is by far the most important article of Greek commerce, and it is said that 120,000,000 lbs. might be produced without difficulty. Little is at present known of the mineral resources of Greece. In ancient times it yielded gold, silver, lead, copper, and iron in large quantities. There are quarries of excellent marble and building stones; and mineral springs are common.

Manufactures and Trade.—The manufactures are very inconsiderable, and are mostly domestic. They comprise woollens, cottons, silks, coarse pottery, leather, soap, and cutlery. Ship-building is extensively carried on in many places. The Greek women are noted for their skill in embroidery. The favourite pursuit of the Greeks is maritime commerce. The merchant fleet in 1860 consisted of 4070 vessels, having in all 263,075 tons, and employing about 30,000 seamen. The exports in 1862 amounted to £797,568; the imports to £314,197.

Population, etc.—In 1821 the population was 675,646; in 1843, 863,003; in 1855, 1,043,153; and in 1861, 1,096,810; to which the population of the Ionian Islands falls now to be added, making the total 1,325,479. The government is a constitutional monarchy; and the legislative power is exercised by the king and the chamber of deputies collectively. By the new constitution, decided on in September 1864, the whole legislative power of the realm is vested in a single chamber of deputies, to the exclusion of a senate or upper house. The new chamber consisted of 282 members, elected by universal suffrage, including 84 from the Ionian Islands. The executive is divided into six departments—interior, finance, justice, public worship, war, and foreign affairs. Though the king is a Protestant, the great mass of the people belong to the Greek Church, and universal toleration is accorded to all creeds. In 1862 the army consisted of 7668 men and 364 officers; the navy of 1 frigate of 50 guns, and 31 smaller vessels, having in all 120 guns. The public revenue was £892,741; expenditure, £885,269; public debt, £6,892,361.

ITALY.

A country of southern Europe, lying between 36° 35′ and 47° N. lat., and 6° 35′ and 18° 35′ E. long. It is bounded on the N. by the Alps, which separate it from Switzerland and Austria; W. by France and the Mediterranean; S. by the Mediterranean; and E. by the Ionian Sea and the Adriatic. Its greatest length, from the Alps in the N. to Cabo-di-Leuca in the S., is about 700 miles; and its breadth, from the head of the Gulf of Trieste to the Rhone in Savoy, is 380 miles, but its general breadth does not exceed 100.

Surface and Climate.—It is separated from the rest of Europe by the Alps, which extend in a semicircular direction from the head of the Adriatic on the one side, to the Gulf of Genoa on the other. These send off branches into the interior, which, however, quickly subside into the fertile and highly-cultivated basin of the Po. This vast plain, 250 miles in length by 150 in breadth where widest, is bounded on the S. by the Apennines, which take their rise from the Maritime Alps, extend along the shores of the Gulf of Genoa, and afterwards continue eastward to about the 12th degree of E. longitude, when they turn gradually southward and traverse the entire length of the Italian peninsula. They send off in their course numerous branches, enclosing valleys which frequently open into extensive plains. The highest summit is Monte Corno, in the Sasso d'Italia, which attains a height of 10,154 feet. The entire country is noted for the beauty and variety of its scenery. It possesses numerous lakes, some of which are of great extent, and add much to the beauty of the scenery. Lakes Como and Iseo, with portions of those of Geneva, Maggiore, Garda, and Lugano, are included in Italy. The rivers are numerous, but, with the exception of the Po, are all of small size. The Tiber, the Adige, and the Arno are the largest of the others. The climate, though varying considerably in different parts, is on the whole dry, mild, and salubrious, except in a few marshy districts, the chief of which are the Maremma in Tuscany, the Pontine Marshes, and part of the Campagna di Roma. The mean annual temperature at Milan is 53·6°; at Florence, 59·4°; at Rome, 60°; and at Naples, 62·2°. In the southern parts snow only falls on the tops and slopes of the mountains. They frequently, however, suffer from the sirocco, or hot wind, which blows from the hot and arid regions of Africa.

Islands.—In the vicinity of Italy are a number of islands, the chief of which are—Corsica, 120 miles in length by 45 in breadth, belonging to France; Sardinia, separated from Corsica by the Strait of Bonifacio, and 160 miles in length by 85 in breadth; Sicily, separated from the southern extremity of the Italian peninsula by the Strait of Messina, only about two miles across, and having an area of about 10,500 square miles; Malta, lying about 60 miles S. of Sicily, belonging to Britain, and having an area of 96 square miles; and Elba, between Corsica and the coast of Italy, 17 miles in length by 10 in breadth. The surface of these islands is generally mountainous, and the coasts are rocky and deeply indented.

Productions, etc.—The soil of Italy is of great fertility, and its climate fits it for the growth of almost all the vegetable productions of Europe. Except in Lombardy, however, agriculture is almost entirely neglected, or is conducted in a very rude manner. In favourable years the grain produced is equal to the home consumption, but very frequently supplies have to be brought from other parts. The chief grain crops are wheat, oats, barley, and rye. Rice is cultivated in the marshy districts of the S., and in the valley of the Po. Flax, hemp, cotton, and tobacco are grown to a considerable extent in many districts. Grapes and olives are very generally cultivated; and oranges, lemons, citrons, pomegranates, figs, peaches, and apricots are among its other fruits. The sugar-cane is cultivated to some extent. The forests are not extensive. The rearing of the silkworm is largely carried on. Except in the N., where the pasturage is very fine, cattle-rearing is not extensively prosecuted. The Piedmontese horse is highly esteemed; but usually the ox takes the place of this animal in agriculture and draught. Sheep, goats, and swine are more common in the central and southern parts of Italy than in the N. In certain parts large herds of buffaloes occur. The wild boar is still common on the Apennines. The people on the coast are mostly dependent on the fisheries. Iron, copper, lead, antimony, and other metals are found; but mining is almost entirely neglected. Sulphur, borax, nitre, alum, alabaster, lava, and other volcanic products are common. Marble of uncommon beauty is found in different parts. The manufactures are few and unimportant. Silk is the most important. The chief of the others are woollen and linen stuffs, glass, porcelain, paper, parchment, and jewellery. The arts and sciences are still cultivated with considerable success. The chief exports are wine, oil, wool, honey, straw-hats, and silk. The Roman Catholic is the established religion in all the states. Education is in a very backward state, and among the lower orders is almost entirely neglected.

Divisions.—The new *Kingdom of Italy* now comprises nearly the whole of this territory, which was formerly divided among a number of independent states. The title King of Italy was first assumed by Victor Emmanuel II. on 17th March 1861. His kingdom embraced that of Sardinia (with the exception of the province of Savoy and the arrondissement of Nice, ceded to France by the treaty of 24th March 1860); those parts of Lombardy ceded by Austria 11th July 1859; the duchies of Parma, Modena, and the Romagna, and the Grand Duchy of Tuscany, annexed in March 1860; and the Marches, Ombria, and the kingdom of the Two

Sicilies, annexed 17th December 1860. It has an area of 94,968 square miles, and a population (in 1862) of 21,776,953. In 1862 the revenue was estimated at £32,936,445, the expenditure at £38,955,382; while the public debt amounted to £120,714,694. The effective army consisted of 11,891 officers and 225,660 men; while the navy comprised 107 vessels of all kinds, mounting 1095 guns. The *States of the Church* now comprise only Rome and its Comarca, the legation of Velletria, and the delegations of Viterbo, Civita Vecchia, and Frosinone, having in all an area of 4538 square miles, with a population of 700,000.

ASIA.

Asia is the largest of the great divisions of the earth. It was the original seat of the human race, and the region where civilisation, arts, and commerce made their earliest advances. This division of the globe lies to the E. of Europe and Northern Africa, extending from 1° 20′ N., or, including the islands of the Indian Archipelago, from 11° S. to 78° N. lat., and from 26° to 190° E. long. It is bounded on the N. by the Arctic Ocean; E. by the Pacific; S. by the Indian Ocean; and W. by the Red Sea and a line drawn across the Isthmus of Suez, which connects it with Africa, and by the Mediterranean, the Sea of Marmora, the Black Sea, the range of Caucasus, the Caspian Sea, the Ural River and Mountains, and the River Kara, which separate it from Europe. Its greatest length in a N.E. direction, from the Isthmus of Suez to Behring's Straits, is about 6500 miles; its greatest breadth, from Cape Sievero Vostotchnia, in Siberia, to the S. extremity of the Malayan peninsula, is about 5200 miles. Area estimated at about 17,000,000 square miles; population probably about 650,000,000. The coasts are indented by numerous seas, gulfs, and bays, the most important of which are—the Gulf of Obi, on the N.; the Gulf of Anadir, the Sea of Okhotsk, Gulf of Tartary, Sea of Japan, Yellow Sea, and the Gulf of Tonquin, on the E.; and the Gulf of Siam, the Bay of Bengal, Arabian Sea, and Persian Gulf, on the S. The principal Asiatic peninsulas are Arabia, India, the Eastern Peninsula, Corea, and Kamtschatka. Owing to its vast extent, this continent is extremely varied in its character, climate, and productions. The surface is for the most part flat, although it rises sometimes to a great elevation above the sea. The central portion of Asia consists of two large elevated table-lands, differing from each other in extent and height. Of these, the eastern, comprehending Tibet and Mongolia, has an area of about 7,600,000 square miles, and a height varying from 4000 to 10,000 feet above the sea. The western table-land is that of Iran, which has an area of about 1,700,000 square miles, and rarely rises higher than 4000 feet above the sea. The whole of the region lying N. of the Altai Mountains and N.W. of the Thian-shan, including the whole of Siberia, consists of a vast plain from 200 to 1200 feet above the sea. The southern portion of Asia lying along the shores of the Indian Ocean is in general low and flat.

Mountains.—The principal mountains of Asia, which include the highest in the world, lie between 28° and 52° N. lat., and consist of four great ranges, nearly parallel to each other, extending from W. to E. The farthest south is the Himalaya range, which extends in general from N.W. to S.E., and consists of three parts—the Hindoo Koosh, or Indian Caucasus, which extends from the mountains of Afghanistan to Cashmere; the Himalayas proper; and the mountains of Bhotan and Assam. The entire length of the chain, from the western extremity of the Hindoo Koosh to the Brahmapootra, is about 1800 miles, and the average height is reckoned at 16,000 or 20,000 feet. The highest mountain in the world, Mount Everest, is in this chain, in 27° 59′ N. lat. and 86° 58′ E. long., and attains the height of 29,002 feet above the level of the sea. The Kuen Lun Mountains run nearly parallel to the Himalayas, and extend, under various names, from the S.W. coast of the Black Sea to about the 100th degree of E. long. In Asia Minor this range is known by the name of Anti-Taurus; in Persia, of Elburz; and further west, by those of Hindoo Koosh, Kuen Lun, Aneuta, and Kulkun. Except the Andes in S. America, this chain is the longest in the world. N. of the Kuen Lun, and stretching in the same direction, are the Thian-shan, or Celestial Mountains, rising from the plains of Turkestan, and extending E. along the 42d parallel of latitude as far as the Gobi, or desert of Mongolia. The highest summit of this range is Bogdo Oola, or the Holy Mountain, which rises above the line of perpetual snow. The Altai range extends along the S. of Siberia, from the near confluence of the Bukhtarina and Irtish to Mount Gurbi, at the S. of Lake Baikal, but its continuations and branches under various names stretch as far as the Sea of Okhotsk and the East Cape. The principal other mountains of Asia are—the Ural Mountains and the Caucasus, which separate it from Europe; the Taurus, in the S. of Asia Minor; the Persian Mountains and the Ghauts in India, both stretching from N.W. to S.E.; the Vindhaya Mountains, in Upper India; the Assam Mountains and the mountains of Mongolia, known by the various names of Ala-shan, Inshan, and Khin-shan-Oola, all having a general direction from S.W. to N.E.

Rivers, Lakes, etc.—The largest river in Asia, and in the Old World, is the Yang-tse-kiang, or Blue River, which rises to the S.E. of the Kuen Lun Mountains, and flows eastward through Tibet and China in an irregular course, till it falls into the Pacific Ocean at Nanking. Its principal tributaries are the Ning-kiang, Heng-kiang, and Kia-kiang, from the right, and the Wulangho, Li-kiang, Yang-kiang, Men-kiang, Kialing-kiang, and Han-kiang, from the left. Its length exceeds 3000 miles, and it drains an area of 740,000 square miles. The Hoang-ho, or Yellow River, rises near the sources of the Yang-tse-Kiang; and though distant from it during the most part of its course, in which it takes a bend to the N. into Mongolia, it falls into the sea near the mouth of that river. The Hoang-ho has a length of 2700 miles. The Obi rises in the Altai Mountains, and flows in a N.W. direction through Siberia until it receives the Irtish, when it turns towards the N., and falls into the Gulf of Obi, in the Arctic Ocean, after a course of 2070 miles. The Yenesei rises in the N. of Mongolia, flows first W. and then northwards through Siberia to the Arctic Ocean, into which it falls, after a course of more than 2500 miles. The Lena, also in Siberia, rises near Lake Baikal, and flows first E., then N., till it falls into the Arctic Ocean, after a course of 1600 miles. The Amur, in Manchooria, has a length of nearly 1800 miles, and falls into the Gulf of Tartary. The rivers of the Eastern Peninsula are very little known, except near their mouths; and the principal are Mekon or Cambodia, the Menam, and the Salwein. The Indus or Scinde rises in the Himalaya Mountains, flows southwards, and falls by several mouths into the Indian Ocean. It has a length of 1800 miles. It receives from the left the five rivers of the Punjaub, namely, the Garra or Sutlej (anciently the Hyphasis), the Bejah (Hysudrus), the Ravee (Hydraotes), the Jelum (Hydaspes), and the Chenab (Acesines). The Ganges rises in the Himalayas, and flows eastward till, after a course of 1600 miles, it falls into the Bay of Bengal by two principal branches, one of which, called the Hoogly, flows past Calcutta. Its principal affluent is the Jumna, which receives the Chumbool and the Betwa, and falls into the Ganges at Allahabad. The Brahmapootra rises in the Himalayas in Tibet, flows at first eastward, then turns W. and afterwards S., and falls into the Bay of Bengal, near the mouth of the Ganges, after a course of 850 miles. The Euphrates and the Tigris rise in the mountains of Armenia, flow in a S.E. direction, and after uniting and forming the Shat-el-Arab, fall into the Persian Gulf. The length of the Euphrates is more than 1600 miles, and of the Tigris about 820. The Jordan, the Orontes, the Cydnus, the Meander, the Hermus, and the Halys, which are the principal rivers in Syria and Asia Minor, are more remarkable in a historical than in a geographical view. The Oxus, in Turkestan, rises in the Hindoo Koosh, flows N.W. for 950 miles, and falls into the Sea of Aral. Asia does not contain so many lakes as Europe, but some of them are of great size. The Caspian Sea, the largest inland sea in the world, is about 750 miles in length, 230 in breadth, and has an area of 18,000 square miles. The Sea of Aral, in Turkestan, has a length of 270 miles, a breadth varying from 100 to 130, and an area of 3372 square miles. Neither of these vast bodies of water has any outlet. The most important of the other Asiatic lakes are lake Tengiz or Balkash, in Turkestan, and Lake Baikal, in Siberia.

Islands.—An immense number of islands, some of them of large size, belong to this division of the globe. The Aleutians are a numerous group, stretching from the N.E. coast of Asia to the opposite coast of N. America. Off the coast of Manchooria and Corea are Saghalien, and the islands of Japan, the largest of which is Niphon. The islands of Formosa and Hainan lie off the coast of China. S. of Formosa are the Philippines, between 5° 30′ and 18° 30′ N. lat., comprising about 100 large and small islands. The island of Palawan and the Sooloo Archipelago lie between the Philippines and Borneo, which last is the largest of the East Indies, and is nearly equal in size to France. Celebes lies to the E. of Borneo, from which it is separated by the Strait of Macassar. S. of Borneo is the island of Java; and to the W. is Sumatra, separated from the Malayan peninsula by the Straits of Malacca. The Moluccas number about 100, and lie to the E. of the East Indian Islands. The island of Ceylon lies E. of the S. extremity of Hindostan, from which it is separated by the Palk Strait and the Gulf of Manaar.

Climate.—The continent of Asia, on account of its vast extent, exhibits the most different and varied climates, from that of the torrid zone in the S. to the frigid zone in the N. The southern regions, although lying in the torrid zone, have not the extreme heat of those parts of Africa under the same latitudes. The course of the seasons in India and the adjacent countries is more constant than in other tropical countries. The monsoons blow during the summer from the S.W., and during the winter from the N.E. The interior of Asia has in general a much colder climate than the other parts of the world in the same latitudes, owing to its inland position, the great elevation of the land, the immense chains of mountains covered with perpetual snow, and the winds which constantly blow from the cold regions of Siberia, with hardly any intermission or variation. The northern regions are characterised by the dryness of the atmosphere and the low temperature of the soil; and, owing to the vast extent of land, the cold of this country is intense, especially towards the E. Asia contains two large rainless districts, one of which extends from the Himalayas in a N.E. direction as far as the neighbourhood of Nertchinsk, in Siberia, having a length of 2500 miles, a breadth of nearly half that extent, with an area of about 2,000,000 square miles. The other forms part of a larger district, extending from Morocco in Africa to Beloochistan, of which country, as well as of Persia, Arabia, and Syria, it includes large portions.

Vegetable Productions.—As in climate, so also in productions the continent of Asia is very varied. The southern parts of Arabia and Persia, as well as India and the Eastern Peninsula, display the vegetation of tropical countries; the central regions that of the temperate zone; and the northern parts that of Arctic lands. The principal plants raised for food in India and the eastern countries of Asia are rice, maize, millet, and a coarse grain called durra; but in Persia and Syria wheat, rye, barley, beans, etc., are principally grown. These last may be raised in all parts of Asia between the fiftieth and fifty-fifth parallels of latitude, but beyond this they cannot be so easily cultivated; and barley and oats do not extend further N. than 60° lat. The principal trees of Siberia are the pine (*Pinus cimbra*), which here attains an enormous height, and the white poplar. The southern regions of Asia abound in palms; but the central plains, in so far as they have been explored by Europeans, seem to be almost entirely destitute of trees of any kind. The tea-plant is a native of China; but it has also of late been found and cultivated with success in Assam. Coffee is cultivated in Arabia; and sugar, tobacco, and opium form important articles of produce in India and the other countries in the S. of Asia. The vine grows in Syria, Arabia, and Persia; and cotton is raised in these countries, as well as in India. Flax and hemp would grow in almost all parts of Asia; but it is only in the S. and W. that they are to be met with. It is estimated that there are in all 7837 species of plants in Asia, of which 3894 are peculiar to that country.

Animals.—Almost all the domestic animals, with the exception of the sheep, come from Asia. The beasts of prey are very numerous. The most remarkable animals indigenous to the central regions of Asia are the two-humped camel, two species of wild horse, several kinds of oxen, two species of antelope, etc. In the western districts panthers are found, and wild asses of great swiftness, the latter of which are met with also in the Runn in India, and in some of the steppes of Turkestan. The Indian tiger is found as far N. as the sources of the Obi, in Siberia, as well as in Persia and China. In Arabia and Persia the animals, such as lions, jackals, antelopes, and monkeys, have a considerable resemblance to those of the African continent. In the northern regions, reindeer, elks, wolves, bears, martins, and squirrels are the principal animals. In the S. of Asia, tigers, buffaloes, bears, elephants, one-horned rhinoceroses, and antelopes abound. The birds of Asia are many and various. Vultures, eagles, buzzards, falcons, etc., are found in India, which is also the native country of the domestic fowl and the peacock. Parrots are found

throughout the whole of Southern Asia, and there are many other birds of extremely beautiful plumage. The ostrich is not found in Asia, but the cassowary supplies its place in the East Indian Islands. All the common European birds are found also in Asia. The reptiles of Asia are not so numerous as the mammalia; and while some species are very poisonous, others are harmless and extremely beautiful. The pearl-oyster is the most important of the Asiatic mollusca.

Minerals.—Gold is found in Japan, China, and the Eastern Peninsula; silver in China, Manchooria, Japan, and Asia Minor; tin in the Eastern Peninsula; copper in the Ural and Altai Mountains, Japan, China, and Persia; and coal in China and India. Iron extends from the Ural Mountains, through the centre of Asia, as far as the Eastern Peninsula. Besides these, Asia is rich in precious stones, such as diamonds, rubies, topazes, beryls, sapphires, rock-crystals, etc.

The following are the principal countries of Asia:—

RUSSIA IN ASIA, comprises Siberia and the region of the Caucasus, the latter of which we have already included in European Russia. Siberia occupies the whole of the northern portion of the Asiatic continent, extending from the Ural Mountains eastward to Behring Sea and the Sea of Okhotsk, and from the Arctic Ocean southward to Turkestan and the Chinese Empire. It extends from 46° to 78° N. lat., and from 60° to 190° E. long., being nearly 4000 miles in length by about 1900 in general breadth. The area is estimated at 5,163,143 English square miles. Pop. (1858) 4,070,938. The surface is of great uniformity, especially towards the W., where it is nearly an uninterrupted plain. This portion is inhabited by wandering hordes of Cossacks and Kirghiz. The warmest and probably the most fertile part of Siberia is the vale of the Yenesei, which is about 350 miles in length and 200 in breadth. Wheat, rye, and oats are raised here, and a considerable part of the land is used for pasture. The eastern part of Siberia, being more elevated and colder than the rest of the country, contains little cultivated land, and is chiefly inhabited by Tungusi tribes, who subsist by the chase. Siberia is divided into Western and Eastern Siberia, the former including the governments of Tobolsk and Tomsk, with the province of Omsk, and the latter the governments Yenesei and Irkutsk, with the provinces of Yakutsk, Okhotsk, and Kamtschatka. Its chief wealth, however, is its mineral productions. The three great mining districts are in the E. declivity of the Ural Mountains, where there are mines of gold, silver, copper, iron, and platinum; the Bernaul district, in the Altai Mountains, near the Irtish, where there are rich silver and copper mines; and the Nertshensk district, in the basin of the Amur, where gold, silver, lead, zinc, antimony, and arsenic are got. The value of the mineral products is included among those of European Russia. The manufactures of Siberia are unimportant. There is no maritime commerce, but a considerable overland trade is carried on with European Russia, Turkestan, and China. The principal seat of the intercourse with the Chinese merchants is Kiakhta, near the Mongolian frontier, where a large annual fair is held.

TURKEY IN ASIA, comprising Asia Minor, Armenia, Kurdistan, Syria, and Arabistan, has an area of 661,122 square miles, and a population of about 16,050,000. *Asia Minor* has N. the Black Sea and the Sea of Marmora; W. the Ægean; S. the Mediterranean; and E. Armenia and Syria. The coast is irregular, especially on the W. and S., and the surface consists for the most part of an elevated table, from 4000 to 5000 feet in height. The principal mountains are the Taurus range in the S., and Anti-Taurus in the N., both of which run along the coast, and form the boundaries of the table-land. Wheat, barley, durra, and rice are cultivated. The soil is very fertile, and the climate mild and good; but agriculture is in a very low state, owing to the insecurity of property and the low price of labour. The mineral riches of Asia Minor are considerable—gold, silver, iron, and copper being the principal products of its mines. The principal seaports are Smyrna, on the W., and Trebizond, on the N. coast; but though the facilities of Asia Minor for trade are great, the commerce by sea is chiefly carried on by Greeks, and that by land by Armenians. Asia Minor is divided into the eyalets of Anadoli, Karamania, Adana, Sivas, Marash, Trebizond, Dschesair or the islands of the Archipelago, and Cyprus. Population about 10,700,000. *Armenia* and *Kurdistan* comprise the country lying to the E. and S.E. of Asia Minor. The northern part is mountainous and has a severe climate; while the southern part consists of an extensive plain, which, though in ancient times fertile, is now barren and covered in many parts by a sandy waste. In the valley of Diarbekir the soil is good, and two crops of wheat and barley are raised in the year; while on the mountains the pasturage is excellent, and supports large numbers of horses, cattle, and sheep. Iron and copper constitute the chief mineral wealth of Armenia. This part of Asiatic Turkey is divided into the eyalets of Erzeroum, Kars, Van, Bayazid, Moosh, Urfa, and Diarbekir. Pop. 1,700,000. *Syria*, or *Sham*, is bounded W. by the Mediterranean, and E. by Kurdistan and Arabia. It is traversed by two parallel mountain-chains called Libanus and Anti-Libanus, which extend from the mountains of Asia Minor almost without interruption to the Red Sea. The most remarkable natural feature in Syria is the great depression of the valley of the Jordan, which sinks to the depth of more than 1300 feet below the sea. The climate is salubrious in the mountainous districts, but hot and unhealthy along the coast. The soil is in many parts very fertile, but is little cultivated. The chief mineral found here is iron. There are no good harbours on the coast, and manufactures and trade are both in a very low condition. It is divided into the eyalets of Aleppo, Damascus, Akka, Jerusalem, Mosul, Bagdad, and the territory of the Druses, and Maronite. Pop. 2,750,000. *Arabistan*, or that part of Arabia which belongs to Turkey, consists of a narrow strip of land extending along the E. shore of the Red Sea, and forming the eyalet of Jedda. Pop. 900,000.

ARABIA.—The remainder of Arabia forms an independant country, inhabited by Arabs, who are governed in a patriarchal manner by sheikhs. The soil is for the most part barren and sterile, and the climate hot; but notwithstanding these natural disadvantages, wheat, durra, barley, beans, etc., are raised in various parts. Manufactures do not exist in Arabia, but some trade is carried on, though not to such an extent as in ancient times, when the only road to India lay through this country. Population about 12,000,000.

PERSIA, or IRAN, lies to the E. of Asiatic Turkey, between 25° and 40° N. lat., and 44° and 61° 30′ E. long. It is bounded on the N. by Caucasian Russia, the Caspian, and Turkestan; E. by Afghanistan and Beloochistan; S. by the Persian Gulf; and W. by Turkey in Asia. Its length from N.W. to S.E. is 1150 miles; breadth from N.E. to S.W. 850 miles; area, 500,000 square miles. Persia occupies part of that extensive table-land which extends from the confines of Turkey eastward to those of India; and is bounded on the N., W., and S. by ranges of mountains. That which bounds it on the N. is called the mountains of Khorasan towards the E., and Elburz towards the W., where it skirts the southern shores of the Caspian. The mountains of Kurdistan, at the northern extremity of which stands Mount Ararat, form the western boundary of the table-land; and the mountainous regions of Farsistan and Kerman, which form its southern boundary, occupy the whole of Persia between the 30th degree of latitude and the Persian Gulf. The E. part of the Persian table-land is occupied by the deserts of Khorasan and Kerman, and presents a very desolate appearance; but towards the W. and along the foot of the mountain-chains tracts of greater fertility are found. Wheat, barley, maize, and rice are the principal crops raised. The most remarkable of the minerals found in Persia is turquoise, which is obtained from mines near Nishapoor, in the N.E. of the country. Iron, silver, lead, copper, and antimony also exist in Persia, but are not worked to any great extent; and coal has been found in the province of Azerbijan. Cotton, woollen, and silk stuffs, fire-arms, cutlery leather, and glass are the principal articles of manufacture. Trade is carried on with India, Afghanistan, Turkestan, Russia, and Britain. The government is despotic, in the hands of the shah, who appoints governors to each province. The revenue is estimated at £1,500,000 or £2,000,000, and the standing army amounts to about 13,000 men, but may be raised on an emergency to 200,000. The religion is Mohammedan. Persia is divided into the provinces of Azerbijan, Ghilan, Mazanderan, Astrabad, Ardelan, Kermanshah, Irak, Ajemi, Khorasan, Farsistan, Luristan, Kerman, and Laristan; and the capital is Teheran, in the province of Irak Ajemi. Population about 10,000,000.

BELOOCHISTAN comprises the tract of country extending along the coast of the Indian Ocean between Persia and India, lying between 24° 50′ and 30° 40′ N. lat., and 57° 50′ and 69° 15′ E. long. It has a length from E. to W. of 700 miles, an average breadth of 300, and an area of about 200,000 square miles. The greater part of Beloochistan is mountainous, especially in the S., but in the N. there is a desert similar to that of Persia, called the Desert of Beloochistan. Except in the N.E. part of the country, there is very little arable land, but here all the kinds of corn raised in India are grown. In the other parts of the country there are extensive pastures, on which large flocks and herds are fed. Gold, silver, lead, iron, copper, tin, and antimony are found in Beloochistan. The inhabitants are chiefly wandering shepherds, living in tents. They consist of two races—the Beloochees, who inhabit the W., and the Brahooes, who inhabit the E. part of the country. The religion of both is Mohammedan. The government, which is of the feudal kind, is in the hands of the khan of Kelat, whom the sirdars or chiefs of the various tribes are obliged to supply with a certain amount of troops. The population is estimated at 2,000,000.

AFGHANISTAN is situated to the N. of Beloochistan, between 28° and 36° N. lat., and 62° and 73° E. long.; being bounded on the N. by Turkestan, E. by India, S. by Beloochistan, and W. by Persia. It is about 470 miles in length by 450 in breadth, and has an area of more than 211,500 square miles. The country is intersected by many mountain-ranges, forming valleys, through which streams flow. The climate and soil vary much at different parts. In the E. all the productions of India may be raised, while towards the N. the vegetation resembles that of colder climates. The plain of Peschawur, in the N.E. of the country, is one of the most fertile regions in the world, yielding three crops annually. Gold, copper, iron, and antimony are the principal minerals in Afghanistan. Manufactures for exportation are not carried on, except at Herat and Candahar, where silk and woollen stuffs and arms are made. Some trade is carried on with India, Persia, Turkestan, and China. The whole country was formerly under the dominion of one king, but it is now divided into the kingdoms of Cabul, Candahar, and Herat. The numerous tribes, however, which compose these kingdoms are all but independent. Population about 7,000,000.

TURKESTAN, or INDEPENDENT TARTARY, is situated between 35° and 46° N. lat., and between 51° and 77° E. long.; being bounded on the N. by Siberia, E. by the Chinese Empire, S. by Afghanistan and Persia, and W. by the Caspian. In the S.E. of this country, near the sources of the Amoo, or Oxus, there is a mountainous region which gradually slopes down on all sides to a level plain. The nature, productions, and climate of the different parts of this extensive country cannot fail to be very various, but comparatively little is known of it. It is inhabited by wandering tribes of Turks, or Tartars, professing the Mohammedan religion, and is divided into the khanates or kingdoms of Khiva, Bokhara, Khokan, Kunduz, and Budukshan, together with the steppes of the Kirghiz. The population is estimated at 4,000,000.

For an account of INDIA, see below.

The EASTERN PENINSULA, or FURTHER INDIA, between 2° and 26° N. lat., and 92° and 109° E. long., comprises the various countries occupying the peninsula which lies between the Bay of Bengal and the Chinese Sea, viz.—The Birman Empire, Laos, Siam, the British possessions, the Malay Peninsula, and the Empire of Anam. *Birmah* is bounded on the N. by Tibet; E. by China, Laos, and Siam; and S., W., and N.W., by the British possessions in the Eastern Peninsula; having a length of 540 miles, a breadth of 420, and an area of about 96,000 square miles. On the E. and W. borders of the country two mountain-chains, branches of the Himalaya range, extend from N. to S., gradually diminishing in height as they approach the sea. There are also smaller mountain-ranges on the N., but towards the S. there is an extensive plain containing the delta of the Irawady. This river, which is the principal stream in Birmah, flows southward, and falls into the Indian Ocean. Birmah is very rich in minerals. Gold, silver, copper, lead, etc., as well as many kinds of precious stones, are obtained. Agriculture and manufactures are in a very low state, but some commerce is carried on with China. The government is a hereditary despotism, and the religion is Buddhism. Population about 4,000,000. *Laos* is bounded N. by China, E. by Anam, S. by Siam, and W. by Birmah. This country is inhabited by several separate nations, most of them subject to Birmah or China. Population more than 1,000,000. *Siam* is situated in the centre of the peninsula, S.E. of Birmah, and has an estimated population of about 4,000,000. Iron is the principal mineral, and rice the principal crop raised; but little progress has been made in civilisation. The government is an absolute monarchy, and the religion Buddhism. The Malay Peninsula belongs also to Siam, and has a population of 375,000. *Anam* is bounded on the N. by China, E. and S. by the Chinese Sea, and W. by Laos and Siam; and is divided into Tonquin, Cochin China, and Cambodia, the first of which is rich in gold, silver, copper, and iron. Rice is the principal crop raised. The government is a military despotism, and the religion a sort of Buddhism. Population about 5,000,000.

The CHINESE EMPIRE comprises China proper, Manchooria, Mongolia, and Tibet, and has a total area of 5,300,000 square miles. It is bounded N. by Siberia, E. and S.E. by the Pacific, S. by Hither and Further India, and W. by Turkestan. *China proper* lies between 20° and 41° N. lat., and 97° and 123° E. long., having a length from N. to S. of 1474 miles, a breadth of 1355, and an area of 1,348,870 square miles. The northern part is mountainous, while the S. is occupied by an extensive plain, remarkable as being the most densely-populated tract of like size in the world. Coal is very abundant in China, and other minerals, as gold, silver, iron, copper, etc., are found. Agriculture is carried on with great industry and success, the principal crop raised being rice; and tea, which as an export is the most important production of the country, is cultivated with great care, especially between 25° and 31° N. lat. Very little attention is paid to pasturage in China, and no good land is used for that purpose; the cattle are few and of inferior quality. The manufacturing industry of the Chinese is considerable, and the principal productions are porcelain, silk, cotton stuffs, carved works in ivory, etc. The commerce of China is chiefly internal, and the country is little dependent on foreign trade, which is discouraged by the government. In addition to the ports formerly opened to foreigners—Canton, Amoy, Foo-chow, Ningpo, and Shanghai—some others have recently been opened by the treaty of Tien-tsin, 1858. The principal exports are tea and silk, and though the importation of opium is illegal, a large contraband trade is carried on in it. The government is an absolute despotism, at the head of which is the emperor, who is also looked upon as the sole vicegerent of Deity. China is divided into twenty provinces, and the capital is Pekin. Population estimated at about 400,000,000. Besides China proper, the Chinese Empire contains *Manchooria*, which is bounded N. by Siberia, E. by the Sea of Japan, S. by Corea, and W. by Mongolia, with an area of 700,000 square miles, and a population of from 2,000,000 to 4,000,000; *Mongolia*, bounded N. by Siberia, E. by Manchooria, S. by China, and W. by the western provinces of the empire, with an area of 1,400,000 square miles, and a population of about 2,000,000; *Si-Yu*, or the *West Land*, comprehending *Thian-shan Pe-lu* to the N., and *Thian-shan Nan-lu*, to the S. of the Thian-shan Mountains, the latter sometimes called Chinese Turkestan, or Little Bucharia; and *Tibet*, bounded N. by these provinces, E. by China, and S. and W. by India. The peninsula of *Corea* and the islands of *Loo-Choo* are tributary to China.

The Empire of JAPAN comprehends Japan proper, or the islands of Nipon, Kiu-Siu, Sitkokf, and others of smaller size; and the dependencies of Yesso, the S. part of Saghalien, and the three southernmost of the Kurile Islands. The entire number of islands is more than 1000, and the area of the empire 170,000 square miles. The soil is generally poor and the country mountainous; yet cultivation is carried on, as in China, to a great extent, and rice and tea are the principal articles raised. Manufactures, similar to those of China, are carried on to a great extent. The trade, like that of China, is chiefly internal, and carried on by coasting. The form of government is a sort of feudal system, and there are two emperors, one with supreme authority in civil, and the other in ecclesiastical matters. Population estimated at 42,000,000.

The European Possessions in Asia, with their areas and populations, are as follows:—

	Area in Sq. Miles.	Population.
I. BRITISH:		
Hindostan	933,722	135,634,244
Ceylon	24,700	1,919,487
Labuan	50	2,442
Hong Kong	29	94,917
II. FRENCH POSSESSIONS	10,806	2,219,878
III. PORTUGUESE:		
India (Goa, etc.)	1,066	313,262
Timor, Solor, etc.	34,282	918,300
Macao	11	29,587
IV. SPANISH:		
Manilla	30,787	1,822,200
Biscayas	18,749	803,000
IV. SPANISH—*Continued.*		
Babuyanes & Bashees	1,260	5,000
Mindanao	1,295	43,800
Marian Islands	1,210	5,500
V. DUTCH:		
Java	50,000	12,718,717
Madura	2,700	
Sumatra	160,000	1,079,742
Billiton	2,250	13,172
Borneo	200,000	873,305
Celebes	70,000	266,030
Moluccas	60,000	521,620
Timor	13,500	1,847,146
Bali	3,000	32,170

HINDOSTAN.

Hindostan, or India, is an extensive country of Southern Asia, extending from the Himalaya Mountains southward to Cape Comorin, and lying between lat. 8° and 35° N., and long. 66° and 99° E. On the N. it is separated from the elevated table-land of Tibet by the Himalaya Mountains; on the W. the Suliman range separates it from Afghanistan and Beloochistan; on the E. continuous ranges of mountains and wooded hills separate it from Birmah; while on the S. the country projects in the form of an irregular triangle into the Indian Ocean for about 1000 miles. Its length from N. to S. is about 1900 miles, and its breadth, where greatest, 1800 miles; but its area does not exceed 1,564,201 square miles.

Surface and Climate.—The coasts of Hindostan are singularly destitute of indentations, especially on the E.; and with the exception of Bombay, where a few projecting islands form an admirable shelter for shipping, the harbours are all at the mouths of large rivers. The surface and climate are extremely diversified. In the north the lofty chain of the Himalayas rises gradually from the plain in successive ranges, till at about 100 or 150 miles from its base it attains its highest elevation. Many of the peaks exceed 23,000 feet in height, some even 28,000, and one recently measured, Mount Everest, rises to the height of 29,002 feet above the level of the sea, being the highest known mountain in the world. South of this alpine region is the great plain of Hindostan, contained between the Indus and the Brahmapootra, and extending to from 1200 to 1400 miles from E. to W., and from 300 to 400 from N. to S. Where water can be obtained, this plain is generally fertile, and is, with few exceptions, a level country, consisting chiefly of the great plain of the Ganges, which is clothed with the most luxuriant vegetation. Westward, however, in approaching the Indian Ocean, wild tracts of country occur, overgrown with jungles, the haunts of wild beasts; and still further W. is the province of Cutch, a cold and sterile waste, half covered with a salt morass called the Runn. N. of the Runn is an immense sandy desert about 500 miles in length by about 400 in breadth. The country S. of the Nerbudda consists almost entirely of an elevated table-land. The chain of the Western Ghauts extends southward from the River Taptee to Cape Comorin along the W. coast, from which it rises very abruptly at the distance of 30 or 40 miles. Eastward from this range is an elevated table-land about 3000 feet above the level of the sea. The Eastern Ghauts run parallel to the opposite coast, but at a much greater distance, and have a gradual slope towards the shore. The Vindhaya Mountains extend from E. to W. across the country, and join the extremities of the E. and W. Ghauts. These ranges send off various chains into the interior of the country. In the interior, especially towards the north, the country is wild, woody, mountainous, and overrun with thick jungle; but along the coasts and in the valleys of the rivers, tracts of great fertility occur. The northern portion of this country lying between the Nerbudda and Krishna, about 800 miles in length from N.W. to S.E., is called the Deccan. The principal rivers of India are—the Indus, 1700 miles in length; its affluents, the Suttlej and the Ghylum, 900 and 750 miles in length respectively; the Brahmapootra, 1500; Ganges, 1500; its affluents, the Jumna, 780, and the Gunduck, 450; the Godavery, 850; Krishna 700; Nerbudda, 700; Mahanuddy, 550; Taptee, 460; and the Cavery, 400. Cultivation in India depends very much upon irrigation, and hence numerous canals have been constructed, especially in connection with the larger rivers in the N. The upper waters of the rivers Ganges and Jumna have been turned into canals serving for transit as well as irrigation. The Ganges affords about 1600 miles of water-course; the West Jumna, 500; and the East Jumna, 250. The year in India is commonly divided into three seasons: the hot, cold, and rainy. The hot season lasts for about four months, the heat gradually increasing from its commencement to May and June, when the thermometer rises to 100°, and frequently in the interior to 108° and 110°. The rains, which are ushered in by the S.W. monsoon, commence in the S. about the middle of June and somewhat later in the N., and continue till the end of September. The cold season, which succeeds the rains, lasts from November to the middle of February, during which period the thermometer is from 65° to 84°.

Productions.—The vegetable productions of India are extremely varied. In the alpine regions of the N. we find most of the European plants, while in the plains we have the vegetable productions of tropical countries. Rice is the staple grain production; but wheat, barley, millet, and maize are also raised. One of the most important productions is cotton. The raw cotton exported in 1860-61 amounted in value to £7,342,168; and since that time it has largly increased. Flax and hemp are grown in various districts both in the N. and S. Silk was long the exclusive product of India and China, but its cultivation is now very limited. Indigo is largely produced in Bengal. Tobacco is extensively cultivated in all parts, chiefly, however, in the N. The sugar-cane is another extensive cultivation, furnishing one of the chief articles of export. The cultivation of opium is confined to certain districts, and cannot be carried on without the sanction of government. It constitutes one of the chief sources of its revenue. In the year 1860-61 the value of opium exported was £10,184,713, of which more than nine-tenths went to China. It is also extensively cultivated in Malwah and other independent territories of India. The tea-plant has recently been introduced, and is now cultivated to a considerable extent in Assam and other parts of Northern India. The total value exported in 1860-61 was £151,984. The value of the other principal exports was—rice, £2,962,497; seeds, £1,785,526; silk (raw), £1,036,728; sugar and sugar-candy, £1,032,416; indigo, £1,886,525; hides and skins, £661,725; saltpetre, £661,772; jute, £409,372; wool (raw), £478,390; coffee, £337,433. The domestic animals are the ox, buffalo, horse, ass, camel, elephant, hog, dog, sheep, and goat. Among the wild animals are the elephant, rhinoceros, camel, musk and other species of deer, lion, tiger, leopard, panther, bear, wolf, hyæna, jackal, fox, etc. The mineral resources of India are as yet but little known, and have been little taken advantage of. Extensive deposits of coal and iron exist in various parts, and gold is commonly found in the sand of the mountain streams, and is extracted by washing. There are copper mines worked by the natives in several regions of the Himalayas, but the produce is small. Diamonds and precious stones are found in various parts.

Manufactures and Commerce.—The Hindoos display great skill in several branches of manufacture. In weaving they have attained to great excellence, and till the recent improvements in the cotton manufactures of Britain, the Indian muslins were the finest in the world. The silk manufactures were also very famous, but they never came up to those of China. The cashmere shawls of India are still highly prized. The Hindoos have also attained a considerable skill in dyeing, and produce colours both fast and brilliant. In delicate works in ivory and the metals the Hindoos are still almost unrivalled. The internal trade of India is very great, and a large coasting trade is carried on. The total value of the imports of British India (including treasure), for year ending 30th April 1861, was £34,170,793; of exports, £34,090,154. The value of imports from the United Kingdom, was £21,679,032; of exports, £14,210,072. The number of vessels that entered the various ports of British India during the year 1860-61 was 22,931, tonnage 2,547,018; of which 3169, tonnage 1,430,496, were British. The number that cleared was 21,701, tonnage 2,554,956; of which 3441, tonnage 1,435,627, were British. In 1861, 3044 miles of railway had been sanctioned and were in course of construction, besides 1609 miles completed and in operation.

Population.—India is divided into the three presidencies of Bengal, Madras, and Bombay; the province of the Punjab; the North-West Provinces; and the territory under the Governor-General of India in Council. Besides these, there are a number of native states under the protection, or nominally independent, of Britain. Besides these, the Portuguese and French have small possessions in Hindostan. The area and population of these in 1861 are given in the following table:—

BRITISH INDIA.	Area in Sq. Miles.	Population in 1861.		Area in Sq. Miles.	Population in 1861.
Under Gov.-Gen. in Council	170,330	14,165,161	Native States	629,225	51,542,930
Bengal	280,200	41,498,608	Portuguese	1,066	363,788
N.W. Provinces	116,493	30,110,497	French	188	221,507
Punjab	100,406	14,794,611			
Madras	128,550	23,127,855	Total	1,564,201	187,762,469
Bombay	137,743	11,937,512			

Government, etc.—By Act 21 and 22 Vic., cap. 106 (1858), the government of India is taken out of the hands of the East India Company, and all the real and

personal property of the Company, except the capital stock, vested in her Majesty; the revenues, tributes, and other payments being received in her name, and disposed of for the purposes of the government of India. The local administration is regulated by the "Indian Councils" Act of Parliament of 1861, by which the provisions of former Acts respecting the Local Government of India are consolidated and amended. The general administration for India is vested in a Secretary of State and a council composed of fifteen members, who are nominated by the Crown, and hold office during the pleasure of the sovereign. The Governor-General is appointed by the Crown, with a salary of £25,000 per annum. He is assisted by a council of six ordinary members, three of which are appointed by the Secretary of State in Council, and three by her Majesty's warrant. The commander-in-chief of the forces in India may be appointed an extraordinary member of Council. The gross amount of the revenue in 1861 was £42,903,234, being—land, £18,508,991; excise, £52,725; sayer and abkarry (the former, various imposts, as town duties, tolls, licences, etc.; the latter, duties on the manufacture or sale of spirituous liquors and intoxicating drugs), £1,725,738; moturpha (a tax on houses, shops, trades, etc.), £100,639; mint, £288,280; post-office, £608,524; stamp-duties, £1,182,781; customs, £4,161,501; salt, £3,805,124; opium, £6,676,759; miscellaneous, £5,792,172. The total expenditure in India was £40,408,239. The total debt in 1861 was £101,877,081. The total European army in India in 1862 amounted to 75,899 men; of whom 54,837 were infantry, 11,000 artillery, 7062 cavalry of the line, and 3000 royal horse-artillery.

AFRICA.

THIS continent, lying to the S. of Europe, from which it is separated by the Mediterranean, is situated between 37° 20′ N. and 34° 50′ S. lat., and between 17° 32′ W. and 51° 22′ E. long. It is bounded on the N. by the Mediterranean; E. by the Isthmus of Suez, the Red Sea, and the Indian Ocean; S. by the Indian and Atlantic Oceans; and W. by the Atlantic. Its length, from Cape Bianco on the Mediterranean to Cape Agulhas, is about 5000 miles; its greatest breadth, from Cape Verde to Cape Guardafui, is 4800 miles; and its area is 12,000,000 square miles. The coast, which is in all about 16,000 miles in length, is not remarkable for any great promontories or irregularities. The principal bays are the Gulf of Guinea and the Bights of Benin and Biafra on the W. coast, the Gulf of Sidra on the N., and the bays of Delagoa and Sofala on the E. coast; while the principal promontories are—Capes Bianco and Spartel on the N., Cape Guardafui on the E., Cape Agulhas and the Cape of Good Hope on the S., and Cape Verde on the N.W. Of the interior of Africa comparatively little is known; but the whole southern part of it, from Cape Colony to the borders of Abyssinia and the Sahara, is believed to consist of an elevated table-land. The greater part of the northern half of Africa is occupied by the Sahara or Great Desert, which stretches across the country from the vicinity of the Atlantic to the valley of the Nile. This region does not present one uniform, flat, sandy appearance, but frequently rises into hills; and though for the most part characterised by the want of water, it has, especially in the eastern part, many springs, both hot and cold, which give rise to the fertile patches of ground called oases.

Mountains.—The best known of the African mountain-ranges is that of Atlas, in the N. of the continent, extending for 1500 miles, from the neighbourhood of Cape Nun, in a N.E. direction through Morocco, Algiers, and Tunis, to the coast of the Mediterranean. The highest mountain in this range is Hentet, in Morocco, 18,500 feet high. An elevated table-land, called Hamadah, extends from the Gulf of Cabes, S.E. along the frontiers of Tripoli, and on the edge of this rise the Gharian Mountains. A range of mountains, known by the name of Kong, extends from W. to E. along the coast of Guinea. The mountains of the Moon, which were by some supposed to extend westwards from Abyssinia across the continent to the Kong Mountains, and by others believed to be those mountains that extend southward from Abyssinia, are placed by Captain Speke around the N. end of Lake Tangany-ka. Between 10° and 15° S. lat., and about 30° E. long., the Sierra Maxenga, which rises to the height of 1700 feet above the level of the sea, extends from N.E. to S.W. This range continues in a S. direction till it joins the Dragenberg Mountains, in the extreme S. of the continent. Mount Kenia rises to the height of 20,000 feet, exactly under the equator, in E. long. 35°. Several detached mountains of great height also occur on the table-land, such as Kilimanjaro, to the S.E. of Kenia, and about the same elevation; Abba Yared, on the N. of the Abyssinian table-land, 15,000 feet high; and Mendefi, to the S. of Lake Tchad, 8000 or 10,000 feet high.

Rivers and Lakes.—The largest river of Africa, and one of the largest in the world, is the Nile. Its source, notwithstanding many attempts both in ancient and modern times, remained undiscovered till recently, when it was determined through the exertions of Captains Speke and Grant. It was found to issue in a broad clear stream from a vast lake, Victoria Nyanza, about 230 miles in length and breadth, and 3740 feet above the level of the sea. It flows in an irregular course towards the N. till it falls into the Mediterranean by several mouths. Its length is 3766 miles. It receives on the right the Bahr el Azrek, or Blue River, which was formerly believed to be the true Nile; and also the Atbara; but from its junction with that river to the sea, a distance of 1200 miles, it receives no other streams. The Luffia, which rises in Lake Tanganyika, near the centre of the continent, flows eastward and, after receiving the Luapula, falls into the Indian Ocean. Lake Tanganyika lies between 3° 55′ and 6° 30′ S. lat., and between 8° and 9° 30′ E. long.; and receives from the W. the Cassaby and other affluents. To the S.E. of this lake is a smaller one called Nyassa, near which rises the River Zambesi. It flows first S., and after receiving the united waters of the Chobe and Leambye, which have a greater length than itself, turns towards the E., and falls into the Indian Ocean. The Orange River rises in the Dragenberg Mountains, and after a course of 1000 miles in a westerly direction, falls into the Atlantic. The Cunene, Coanza, and Zaire or Congo also flow into the Atlantic from the E.; but of these rivers very little is known. The Niger, Joliba, or Quorra, which is second to the Nile among the African rivers, has not been entirely explored. It rises in the mountains to the E. of Liberia, and after a circuitous course of about 3000 miles, falls into the Atlantic between the Bight of Benin and that of Biafra. The Senegal and the Gambia flow W. into the Atlantic. The principal lakes of Africa, besides those already mentioned, are Lake Tchad, near the centre, and Lake Ngami, near the S. of the continent—both of great extent.

Climate.—Lying almost entirely within the torrid zone, Africa is the hottest of all the continents. The greatest heat, owing to the extent and lowness of the country, is found to the N. of the equator, in the Sahara. The E. of the continent is visited by the monsoons of the Indian Ocean, and the N. by the sultry S. winds from the Sahara. The W. of Africa, owing to the heat and sulphureous exhalations, is extremely unhealthy. The N. is almost entirely destitute of rain; but towards the E. the place of this is supplied by the periodical inundations of the Nile, which are caused by the rain brought by the monsoons to the mountains near its source.

Vegetable Productions.—The northern regions of Africa resemble in their flora the S. of Europe. Wheat, barley, and maize are cultivated; while oaks, pines, cypresses, etc., are the common trees. The Sahara is the peculiar region of the date-palm, which furnishes food for both men and animals in the desert. S. of the Sahara a new aspect of vegetation is seen. The place of corn is here supplied by the cassava, yam, pigeon-pea, and ground-nut; and the baobab, or monkey bread-tree, takes the place of the date-palm. Wheat and other kinds of corn are grown in the S. of Africa; but the most characteristic plant of this region is the heath, of which there are large groves, rising in some cases to the height of twelve or fifteen feet. A considerable extent of Central Africa has recently been explored, and found to be more fertile, more highly cultivated, and inhabited by milder races than the countries previously known.

Animals.—The lion is found in almost all parts of Africa, except in the N.E., the Sahara, and some places where he has been exterminated by European settlers. Panthers, leopards, ounces, hyænas, etc., comprise the other beasts of prey in Africa. Zebras and other striped animals of the horse and ass kind are peculiar to Africa, the zebra stretching S. from 10° N. lat. to the extremity of the continent. The elephant, rhinoceros, and hippopotamus inhabit the country from the Orange River to the Nile, Lake Tchad, and the Senegal. The most valuable of the African animals is the camel, and one of the most characteristic is the giraffe. Among birds, the ostrich, the secretary bird of the Cape, and the guinea-fowl are the most remarkable. Of insects, the locust and the scorpion are the plagues of Africa; and in the interior a sort of fly called *tsetse* is found, whose bite, though not dangerous to man and wild beasts, is fatal to domestic animals.

Minerals.—Gold is found in Soodan, Guinea, and Mozambique; silver near the Zambesi and in the S.W. of Morocco; copper in the Atlas Mountains, in Egypt, on the Zambesi, and in other parts; iron in Egypt, near the Coanza, in the territory of Cazembe, etc.; tin and lead in Loango; and coal at Zumbo, on the Zambesi.

States.—The principal states of Africa are the following:—

Egypt is situated in the N.E. part of Africa, and has an area estimated at 175,812 square miles, of which only about the tenth part is cultivated. The chief cultivated plants are cotton, lint, hemp, indigo, sugar, tobacco, opium, besides wheat, maize, millet, rice. Within the last two or three years the growth of cotton has been greatly extended. It is governed, under the Ottoman Porte, by a hereditary viceroy, or pasha, with absolute power. In 1862 the value of the imports was £2,550,052, and of the exports £12,225,783. Population estimated at 5,125,000. *Nubia* and *Senaar* also belong to the Turkish empire, and have together an area of 394,695 square miles, and a population of 835,600. *Tripoli*, *Barka*, and *Fezzan*, have a total area of 295,701 square miles, and a population of 750,000; and *Tunis* has an area of 77,910 square miles, and a population of 95,000. These countries also are under the Turkish sway. *Algeria*, which belongs to France, has an area of 158,346 square miles, and a population of 2,999,124. The imports of Algeria in 1861 amounted to £6,756,652, and the exports to about £3,000,000. *Morocco*, which is an independent kingdom, has an area of 287,700 square miles, and a population of 8,500,000. The *Saharan* countries, which stretch from the Atlantic on the W. to Nubia on the E., comprise an area of 2,000,000 square miles, and are occupied by three distinct races—the Moors in the W., the Tuaricks in the centre, and the Tibbus in the E. *Senegambia* occupies the region of the Senegal and Gambia, and is inhabited by various Negro nations. The French have settlements on the Senegal, containing 11,599 inhabitants; the British on the Gambia and at Sierra Leone, with a total area of 133,079 square miles, and a population of 335,279. The Portuguese settlements on this coast have an area of 35,437 square miles, and a population of 1095; and the Cape Verde Islands, which likewise belong to Portugal, have an area of 1629 square miles, and a population of 85,393. The republic of *Liberia*, which was founded in 1822 for the reception of free Negroes from America, extends for 320 miles along the coast of Guinea, and on an average 80 inland, and has a population of about 500,000. The Dutch colonies on this coast have an area of 1500 square miles, and a population of 100,000; and the British settlements on the same coast have a population of 385,000. The country in the centre of Africa, known by the general name of *Soodan* or *Nigritia*, comprehends many independent states, such as *Bambarra*, *Timbuctoo*, *Houssa*, *Bornu*, etc. The Portuguese possessions of *Angola* and *Benguela*, on the S.W. coast, have an area of 200,602 square miles, and a population of 589,127. The English colony of Cape Colony or Cape of Good Hope has an area of 168,000 square miles, and a population of 267,096. It exports wool, skins, copper, ostrich feathers, cotton, ivory, hides, etc.—value (1862), £1,517,851; imports, £2,034,558. Natal, also an English colony, has an estimated area of 25,000 square miles, and a population of 11,580 Europeans and 150,000 Kaffirs. Exports (1862), £127,228; imports, £449,469. *Mozambique* and its dependencies, which belong to Portugal, have an area of 283,500 square miles, and a population of 300,000. The only other state in Africa of any importance is *Abyssinia*, which has an area of 1500 square miles, and a population estimated at 4,000,000 or 5,000,000.

NORTH AMERICA.

THIS great division of the world comprehends all that part of the American Continent or New World lying N. of the Isthmus of Panama, between 8° and 80° N. lat., and 54° and 166° W. long. It has on the N. the Arctic Ocean, E. the Atlantic Ocean, and W. the Pacific Ocean. Including Greenland and the numerous islands, it has an area of about 8,325,000 square miles.

Coasts and Islands.—The coasts of North America are extremely irregular, being more indented with gulfs and arms of the sea than those of any of the other great divisions of the globe. This is more particularly the case with the E. coast, where, in the N., Davis' Strait and Baffin's Bay separate Greenland from the rest of the continent; and connected with these, by Hudson's Strait, is the immense inland sea of Hudson's Bay. The next great inlet on this coast is the Gulf of St. Lawrence, so called from the great river of that name which falls into its S.W. extremity. Passing over the numerous inlets and bays on the coast of the United States, we come to the Gulf of Mexico, and the Gulfs of Honduras and Darien. The indentations on the W. coast are fewer and less conspicuous. From Panama to the Gulf of California there are no irregularities of importance, and northward, from that to Vancouver's Island, the only indentation worth notice is the fine bay of San Francisco. About Vancouver's Island are several sounds, and from this to 60° N. the coast is exceedingly irregular; while farther N. are Prince William's Sound, Cook's Inlet, Bristol Bay, Norton Sound, and Kotzebue Sound. Exclusive of the minor sinuosities, the E. coast-line from Hudson's Strait to Florida Channel measures about 4800 miles, and from Florida Channel to Panama 4600; the W. coast-line from Panama to Behring's Strait has been estimated at 10,500 miles; while the N. coast-line cannot be less than 3000 miles. The principal peninsulas are Labrador, Nova Scotia, Florida, Yucatan, Old California, and Aliaska. The islands are numerous. Besides the West Indies, the more important are Newfoundland, Prince Edward, Cape Breton, and Vancouver.

Mountains.—The Andes of South America are greatly depressed within the Isthmus of Panama, but a chain which may be considered a continuation of them rises almost immediately and runs N.W., spreading out in Mexico into extensive table-lands crowned by lofty volcanic peaks. Further N. this chain forms the Rocky Mountains, which terminate on the shores of the Arctic Ocean W. of the Mackenzie River; but above 50° N. lat. the elevation is inconsiderable. About N. lat. 22° it divides into several branches, the most easterly of which, nowhere of great height, is, in its northward course, broken through by the Rio Grande del Norte, and then takes a N.E. direction, and forms the high lands in the northern part of Texas. This is the range of hills that crosses the Arkansas and appears in Missouri under the name of the Ozark Mountains, running towards the confluence of the Missouri and the Mississippi, beyond which they probably continue at a slight elevation toward Lake Superior. The general direction of the Ozark is parallel to the Alleghanies. To the westward of the Rocky Mountains there are other chains running parallel with them; and between 34° and 45° N. lat. these form a remarkable table-land, known as the Great Basin, containing an area of about 130,000 square miles, and full of salt lakes, the largest of which is 4300 feet above the level of the sea. The Sierra Nevada of California, which is distinct from the Rocky Mountains, is prolonged northward beyond the Columbia River as far as 47° N. Its general height far exceeds that of the Rocky Mountains, and in the northern section are three lofty summits, Jefferson, Hood, and St. Helen, which rise to the height of upwards of 15,000 feet above the sea. The mountain system of the eastern side of the continent, called the Alleghany or Appalachian Mountains, stretches from about 34° N. lat. to the banks of the St. Lawrence. The general direction of the range, as far as the Hudson, is nearly from S.W. to N.E., but here it turns more to the N., and in New Hampshire attains an elevation of 6428 feet. The highest point, however, of the whole range is the Black Mountain in North Carolina, which rises to the height of 6476 feet. The basin of the Mississippi has no mountain barrier on the N., the watershed between it and the Hudson Bay being formed by a line of gentle undulations (the highest of which attain a height of only 1500 and 1700 feet) between 47° and 48°.

Rivers and Lakes.—Many of the rivers of North America are of great extent. The Mississippi, if we consider the Missouri as forming its main branch, is the longest river in the world, being about 4300 miles in length. The Missouri rises by three principal sources in the Rocky Mountains, about lat. 44° N., long. 110° W., and flows in a very tortuous but generally S.E. direction for about 3100 miles, when it joins the Mississippi, which from its source in Lake Itasca to this point is about 1900 miles in length. The united stream flows generally southward to the Gulf of Mexico, which it enters by numerous mouths. Many of the tributaries of the Mississippi, as the Arkansas, Red River, Ohio, etc., are of great size. The St. Lawrence rises, under the name of St. Louis, in lat. 47° 45′ N., long. 93° W., flows generally E. through the great Canadian chain of lakes, and falls into the gulf of the same name after a course of about 2200 miles. Between Lakes Erie and Ontario it is precipitated over a ledge of rocks 160 feet high, forming the celebrated Falls of Niagara. The largest tributary of the St. Lawrence is the Ottaway, 600 miles in length. Mackenzie River, taken in connection with the Great Slave River and Lake, and the Peace River, whose combined waters it receives, drains an area of about 550,000 square miles, and has an irregular course northward of about 1800 miles. The Rio Grande del Norte and the Colorado are two great rivers of the S., the former falling into the Gulf of Mexico, the latter into that of California. The principal lakes, with their areas in square miles, are—Superior, 32,000; Huron, including Georgian and Manitoulin Bays, 30,000; Michigan, 22,000; Great Bear, 14,000; Great Slave, 12,000; Winnipeg, 10,000; Erie, 9600; Ontario, 6300; Great Salt, 2000.

Climate.—The average temperature on the western coast of North America is higher than on the eastern. In the Oregon valley it is said to be higher than in corresponding latitudes on the Atlantic coast by an amount equivalent to 5 or 6 degrees of latitude, and the winters are also much more moist. The N.W. territories E. of the Rocky Mountains are cold and inhospitable, and not suited for agriculture. In the E. part of the continent agriculture has not advanced farther than 51° or 52° N. lat. Towards the S. the climate of course becomes much warmer, till in Mexico it is essentially tropical, though even here, on the table-lands and mountains, we have the climate of the temperate or even of the frigid zone.

Minerals.—The principal minerals are gold, silver, copper, iron, lead, and coal. The two first are found in great abundance in Mexico; but since 1848 the chief gold-field has been California, where large quantities are obtained. Copper is found in greatest abundance in the vicinity of Lake Superior; lead in S.W. Wisconsin, and in Iowa and Illinois. Coal and iron are widely diffused; the Appalachian coal-field stretches without interruption over a length of 720 miles, with a maximum breadth of 280, and occupies an area of 63,000 square miles. The coal is generally bituminous, but anthracite is also met with, and is very abundant in E. Pennsylvania. There are various extensive coal deposits in other parts, including New Brunswick and Nova Scotia on the N.E., Vancouver's Island off the N.W. coast, and the Gulf States in the S. It has also been found in California and Oregon. Iron is found in all parts of the United States, in Mexico, and in Central America, but the principal deposits are in Pennsylvania. Salt is likewise widely diffused.

Vegetable Productions.—The forests of North America are of vast extent. In the northern zone they consist chiefly of pine, oak, ash, hickory, red beech, and the lofty Canadian poplar. The prevailing trees of the middle zone are sycamore, chestnut, black walnut, hickory, maple, white cedar, oak, and the tulip-tree. In the inter-tropical forests they attain an enormous size, and include the mahogany and other valuable woods. The Arctic flora is not essentially different from that of Europe or Asia in the same latitudes. Maize or Indian corn is the only important farinaceous plant peculiar to the New World. Millet, cocoa, pimento, vanilla, copaiba, cinchona, jalap, sassafras, nux-vomica, tobacco, and the cochineal plant are also indigenous. Wheat, barley, oats, peas, and rice succeed well; the last-named in the southern swamps and inundated lands. The same may be said of the various fruit-trees in their peculiar thermal zones, as the orange, peach, plum, apple, etc.; but the native fruits are mostly of the nut kind. Sugar, coffee, and cotton are among the staple productions of the southern sections; and in the middle and temperate region vines succeed well. The tea-plant and other exotics have been introduced, but as yet with only partial results.

Animals.—The most formidable of the North American animals is the grizzly bear, which is peculiar to this continent. Its haunts are the Rocky Mountains and the adjacent hilly country from Mexico N. to lat. 60°. The Polar bear, though not peculiar to America, is found in great numbers on the northern coasts. The musk-ox is also an inhabitant of the most northern parts between 66° and 73° N. lat. The bison or American buffalo, the largest native quadruped, is distributed over a great part of the temperate regions; but its chief haunts are the central prairie-lands, where it is seen in vast herds. The deer tribe is numerous, including the moose-deer or elk and the rein-deer. Wolves and dogs are numerous, and among the latter are the well-known Newfoundland and Mackenzie River dogs. Foxes, beavers, otters, raccoons, opossums, hares, musk-rats, marmots, squirrels, etc., are among the smaller quadrupeds of this continent. Monkeys are confined to the south. Reptiles are very numerous, and many of them are poisonous. The most noted is the rattlesnake. The cayman is found only in the rivers and lakes of the south, where it frequently attains a great size. The bird tribe comprises 471 species, of which 386 are peculiar to North America. The list includes a variety of eagles, vultures, hawks, owls, etc. Wild turkeys are found in vast numbers in the woods, and water-fowl are extremely abundant near the seas and lakes. In Mexico and Central America the aborigines still form the bulk of the population; but in Canada and the United States there are now only small remnants of once powerful nations. They are of a bronze or cinnamon colour; robust and well-proportioned; with long, coarse, and shining black hair; square-shaped head; thin beard; low forehead; prominent cheek-bones, and nose somewhat flattened; and features, when viewed in profile, prominent and deep-set. They are constantly decreasing in numbers and giving place to the white man.

Population.—The following table gives the area and population of the various political divisions of North America:—

Divisions.	Area in Sq. Miles.	Population.	Divisions.	Area in Sq. Miles.	Population.
Arctic lands (unoccupied)	600,000	...	United States of America	3,098,256	31,445,080
Greenland (Danish) .	380,000	9,400	,, ,, Mexico	802,366	8,137,353
Russian America . .	481,276	54,000	British Honduras, etc.	19,200	25,635
Hudson's Bay Territory	2,436,000	150,000	States of Cent. America	200,000	2,174,000
British Colonies . .	523,162	3,182,069			
French Islands . .	118	1,338	Total . .	8,540,378	45,179,375

DANISH AMERICA.—Greenland, or Danish America, is separated from the continent of America by Baffin's Bay and Davis' Straits, and extends northward from Cape Farewell, in lat. 59° 48′ N. It is a mountainous and barren region, covered with almost perpetual snow and ice. The climate is intensely cold, though during the short summer, which is one continuous day, the sun has considerable power. Vegetation even in the S. is almost suspended; a few stunted birch, alder, and willow trees, with mosses, lichens, fungi, etc., being almost its only vegetable productions. On the W. coast, however, the inhabitants succeed in cultivating a few culinary vegetables. The Danish colonies extend along the W. coast to about 74° N. Population, 9400; of whom about 250 are Danes and other Europeans. They are chiefly engaged in fishing and seal-hunting.

RUSSIAN AMERICA comprehends the N.W. portion of the continent, with the adjacent islands, extending from Behring Strait E. to the meridian of Mount St. Elias (about 141° W.), and from that mountain southward along the Maritime chain of hills till it touches the coast about 54° 40′. The surface is mostly of a mountainous character. Mount St. Elias rises to the height of 16,758 feet. The climate, though not so cold as in similar latitudes on the E. coast, is yet too cold to admit of agricultural operations, and the territory is only valuable for fishing and hunting. It belongs to the Russian American Fur Company; and the capital is New Archangel, a town of about 1000 inhabitants, on Sitka Island.

BRITISH AMERICA.

HUDSON'S BAY TERRITORY includes not only Labrador and the territory in the vicinity of Hudson's Bay, but extends westward and northward as far as the Arctic

and Pacific Oceans and the Russian frontier, and comprises an area roughly estimated at 2,436,000 square miles. A great portion of this dreary country is occupied or intersected by numerous rivers, lakes, and marshes, and the ground is generally barren and desolate, though in some places abundantly wooded. The climate is rigorous and changeable, and winter continues for eight or nine months. There is great abundance of berry-bearing shrubs and culinary herbs, and in some favoured spots barley and other crops succeed well. Fur-bearing animals are numerous. This extensive territory is very sparsely peopled, the entire population being estimated at only about 150,000. They consist chiefly of Esquimaux, who live along the coasts, and Indians, who roam in small bands over the country, subsisting by the chase.

CANADA consists of a long narrow tract of country lying along both sides of the River St. Lawrence, in the lower part of its course, and thence along the northern shores of the great Lakes Ontario, Erie, and Huron. It is about 1200 miles in length, by from 200 to 300 in average breadth, and has an estimated area of 357,822 square miles. It is divided into Canada East or Lower Canada, and Canada West or Upper Canada, the former having an area of 209,990, and the latter of 147,832 square miles. Canada West is characterised by a general evenness of surface. A table-ridge, however, of considerable height stretches S.E. and N.W., forming a watershed between Lakes Superior and Huron and the south portion of Hudson's Bay. A similar watershed traverses Canada East, separating the affluents of the St. Lawrence from the streams falling into Hudson's Bay. Canada West, though much more fertile than Canada East, is inferior to it as regards romantic and picturesque scenery. The physical features of the latter are generally varied and grand, consisting of magnificent rivers and lakes, extensive prairies and forests, bold rocky heights, foaming cataracts, and fertile islands. The lakes of Canada are extremely numerous, the entire surface being thickly dotted with sheets of water of various dimensions, interwoven with a network of connecting streams. Canada is not deficient in mineral resources. Iron of the best quality is abundant, and gold and silver are found in small quantities. Copper mines are successfully wrought on Lake Superior; and lead and tin occur in various places. The climate is much colder than that of Europe under the same parallels, and very much resembles that of Norway and Sweden. Heat and cold are extreme, the themometer ranging from 102° above to 36° below zero. In Canada East the winter begins in the end of November and lasts till the end of April, but in Canada West it is much shorter. The greater portion of the land is thickly wooded with pine, ash, maple, butternut, walnut, cherry, sycamore, cedar, alder, willow, etc. Almost all the fruits of temperate climates succeed in Canada, particularly in the W. Agriculture is the principal employment of the great bulk of the people; but there are also many engaged in the fisheries and commerce, and in the far west mining affords employment to a considerable number of persons. Their manufacturing operations are still very limited, but they are nevertheless making sure and by no means slow progress. Ship-building is extensively carried on at the principal ports. The chief agricultural productions exported in 1861 were, in bushels—Wheat, 7,028,232; barley and rye, 2,203,763; oats, 2,111,046; peas, 2,110,968; Indian corn, 742,476; flour, 1,268,299 barrels. The total value of agricultural produce exported was £3,800,964; of animals and their produce, £766,972; forest produce, £1,994,301. The total value of the exports was £7,627,957, of which £3,938,980 were to the United Kingdom; of the imports for home consumption, £8,969,756. The number of vessels that entered and cleared seawards in 1861 were—entered 2442, tons 1,077,128; cleared 2389, tons 1,059,667. Canada has a number of important canals and railways; of the latter there are about 1700 miles in operation. In 1861 the revenue was £2,322,524; the expenditure £3,071,423. In 1770 Upper Canada contained only about 200 white persons, and Lower Canada in 1676 had only 8415; whereas in 1861 the former contained 1,396,091, and the latter 1,111,566. The populations of the principal towns in that year were—Montreal, 90,323; Quebec, 51,109; Toronto, 44,821. The number of immigrants in 1860 was 10,150. The majority of the inhabitants of Lower Canada are of French origin and Roman Catholics. In Canada the Roman Catholics number 1,201,394 adherents, the Church of England, 375,051; Presbyterians, 347,119; Methodists, 372,232. There are about 4600 schools, averaging from 40 to 45 scholars each; besides 113 colleges, academies, and high schools. In 1861 government expended £105,572 for educational purposes. The executive power is vested in a governor-general appointed by the crown, assisted by an executive council. The parliament consists of a legislative council, the members of which are appointed for life by the various governors, and a legislative assembly consisting of 130 members, elected by the people. It is proposed to form Canada and the other British possessions in North America into one federation, having a government and a parliament, formed, as far as circumstances will permit, on the model of the British constitution; the parliament to consist of a legislative council and a house of commons. The federation is to comprise three divisions—1. Upper Canada; 2. Lower Canada; and 3. Nova Scotia, New Brunswick, and Prince Edward Island; and the legislative council to consist of 24 members for each division, named for life by the crown. The representation in the house of commons will have for its basis the population, determined by the official census taken every ten years. At present the number of members will be—for Upper Canada, 82; Lower Canada, 65; Nova Scotia, 19; New Brunswick, 15; Newfoundland and Prince Edward Island, 6;—the parliamentary session to be for five years, unless previously dissolved by the governor-general.

NEW BRUNSWICK lies between 45° and 48° N. lat., and 63° 47′ and 67° 53′ W. long.; and is bounded on the N. by the Bay of Chaleurs and the River Ristigouche, which separate it from Lower Canada; E. by the Gulf of St. Lawrence; S. by Nova Scotia and the Bay of Fundy; and W. by the St. Croix River and the State of Maine. It is about 200 miles in length from N. to S., by 140 in breadth. Area, 27,105 square miles. The shores are usually low, and the interior is generally undulating, and sometimes mountainous. A large portion of the surface is covered with magnificent forests. The chief employments are agriculture, lumbering, mining, and the fishing. The mineral productions are important, including coal, iron, copper, plumbago, manganese, lime, gypsum, and grindstones. Productions, 1861—Wheat, 279,775 bushels; barley, 94,679; oats, 2,656,883; buckwheat, 904,321; maize, 17,420; peas and beans, 30,667; turnips, 634,364; potatoes, 4,041,339; live stock—horses, 35,347; cattle, 161,462; sheep, 214,092; and swine, 73,995. In 1861 the value of the exports was £947,091; imports, £1,238,133; revenue, £145,594; expenditure, £176,051. Population (1861), 252,047; of whom 249,254 were whites.

NOVA SCOTIA, including *Cape Breton Island*, which is separated from it by the Gulf of Canso and Sable Island, is situated between 43° 20′ and 47° 5′ N. lat., and 59° 38′ and 66° 20′ W. long., and is connected with New Brunswick by a narrow isthmus. It is 260 miles in length from N.E to S.W., and varies in breadth from 50 to 104 miles. Area, 18,746 square miles. Its coasts are deeply indented, and its harbours are numerous, capacious, and safe. The surface is undulating, and about one-third of it is occupied by lakes. Iron, lead, copper, coal, gypsum, marble, and other minerals abound. The climate is one of moderate extremes. Population (1806), 67,515; (1861) 330,857. The principal employments are agriculture, mining, and fishing. Chief productions in 1861—Wheat, 312,081 bushels; barley, 269,758; rye, 59,706; oats, 1,978,137; buckwheat, 195,340; maize, 15,529; potatoes, 3,824,864; maple sugar, 249,549 lbs.; butter, 4,532,711 lbs.; cheese, 901,296 lbs. Value of exports (1861), £1,154,867; of imports, £1,522,645. Revenue, £146,050; expenditure, £129,857.

PRINCE EDWARD ISLAND lies in the Gulf of St. Lawrence, immediately N. of Nova Scotia, and separated from it by Northumberland Strait. It is about 140 miles in length by 34 in extreme breadth, and has an area of 2134 square miles. The surface is undulating, and the soil for the most part very fertile. Wheat, barley, oats, potatoes, and turnips are the chief agricultural productions. Value of exports (1861), £163,114; of imports, £209,936. Revenue, £28,006; expenditure, £32,800. Population (1861), 80,857.

NEWFOUNDLAND, a large and irregularly-shaped island lying off the Gulf of St. Lawrence, between lat. 46° 40′ and 51° 39′ N., and long. 52° 44′ and 59° 31′ W. Area, 40,200 square miles. Its shores are extremely broken and rugged, and the surface is an alternation of hills and valleys. A great part of it is occupied by lakes, ponds, and marshes. The inhabitants depend for support not so much on agriculture as on commerce and the fisheries. Value of imports (1861), £1,152,857; of exports, £1,092,551. Revenue, £90,043; expenditure, £126,703. Population (1861), 122,638. It stands on an immense bank, with soundings varying from 25 to 95 fathoms, where the cod-fishing is very extensively carried on. Near the S. coast of Newfoundland are the three small islands of Great and Little Miquellon and Saint Pierre, the sole possessions of the French in N. America.

BRITISH COLUMBIA is situated in the N.W. coast of North America, lat. 49° to 55° N., long. 115° to 132° W. It is about 300 miles in length by 420 in breadth, and has an estimated area of 2,000,000 square miles. It is bounded on the south by the territories of the United States, on the west by the Pacific Ocean and the Russian territories in North America, on the north by the parallel of north latitude, and east by the Rocky Mountains and the meridian of west longitude. It includes Queen Charlotte's Islands, and all those adjacent thereto, except Vancouver's Island, and those adjacent to it. The country is rich in minerals, particularly gold, and in fine timber. The climate is temperate, and in various other respects this country is particularly suitable for emigrants. Revenue (1861), £65,000; expenditure, £71,292; value of imports, £282,879; exports, £12,686.

THE UNITED STATES OF AMERICA.

The United States of America stretch across the entire continent from the Atlantic to the Pacific Ocean, and lie between lat. 24° 20′ and 49° N., and long. 66° 48′ and 125° 32′ W. The extreme width of the country, east and west, from Quoddy Head to Cape Lookout, is about 2850 miles; and a line drawn north and south on the meridian of the mouth of the Rio Grande measures about 1600 miles. The outline of the frontiers measure about 10,000 miles, of which 5100 are sea-coast, 1200 lake and river coast, and 3900 land boundaries. Area, 3,098,256 square miles.

Mountains.—This territory is traversed by two principal mountain-chains—the Alleghanies in the E., and the Rocky Mountains in the W. These divide the country into three distinct geographical regions—the Atlantic slope, the valley of the Mississippi, and the declivity from the Rocky Mountains to the Pacific. The Alleghanies are less a chain of mountains than a long plateau crested with several chains, separated from each other by wide and elevated valleys. East of the Hudson these mountains are generally distributed in irregular groups without any marked direction. Some of the peaks of the Green Mountains in Vermont, and of the White Mountains in New Hampshire, rise to the height of 5000 to 6000 feet. After passing the Hudson, the structure of the mountains seems to change. In Pennsylvania and Virginia they assume the form of long parallel ridges, varying in height from 2500 to 4000 feet, and occupying a breadth of 100 miles. In North Carolina the highest point has an elevation of 6476 feet. In Georgia and the northern part of Alabama, where they terminate, they lose their continuous form, and break into groups of isolated mountains, some of which attain a considerable elevation. The Rocky Mountains far surpass the Alleghanies in elevation and extent. Their base is 300 miles in breadth, and their loftiest summits, covered with eternal snow, rise to the height of 12,000 to 14,000 feet. They are from 500 to 600 miles distant from the Pacific, but the country between them and the coast is intersected by several minor ranges. The maritime range, which contains the loftiest mountains in North America, runs nearly parallel to and at a short distance from the coast of the Pacific. The immense valley between the Rocky Mountains and the Alleghanies is intersected by the Mississippi, which runs from N. to S. through the United States. Along the Atlantic coast is a low plain from 50 to 100 miles wide, beyond which the land rises toward the interior till it terminates in the Alleghanies. Except near the water-courses, the soil here is generally sandy and unproductive. The Pacific section of the country abounds in wild and majestic scenery, but a considerable portion of it is desert, as the great California desert.

Rivers.—The Mississippi, which drains the whole country between the Rocky Mountains and the Alleghanies, rises in the state of Minnesota, in lat. 47° 47′ N., amid lakes and swamps, and after a S.E. course of about 500 miles, reaches the Falls of St. Anthony, where it descends perpendicularly 16 feet; and also forms numerous rapids. Thence it pursues first a S.E. and then a S. direction; and after forming the boundary of Minnesota, Iowa, Missouri, and Arkansas on the W., and of Wisconsin, Illinois, Kentucky, Tennessee, and Mississippi on the E., passes through Louisiana, and discharges itself into the Gulf of Mexico. Length, about 3200 miles. Its principal tributaries are—on the E., the Wisconsin, Illinois, Ohio, and Yazoo; on the W., the Minnesota, Desmoines, Missouri, Arkansas, and Red River. The principal rivers of the Atlantic slope are the Connecticut, Hudson, Delaware, Susquehanna, Potomac, and James River; of the Pacific slope, the Columbia, Sac-

ramento, San Joaquin, Colorado, and the Rio Gila. Of those that flow into the Gulf of Mexico, the principal, after the Mississippi, are the Appalachicola, Mobile, Sabine, Trinity, Brazos, and the Rio Grande.

Lakes.—With the exception of Michigan, none of the great lakes of North America lie wholly within this territory. The Lakes Superior, Huron, Erie, and Ontario lie on the northern border, along which they form a connected chain of nearly 1200 miles in length. Lake Champlain, between New York and Vermont, is 130 miles in length by 10 in breadth, and discharges its waters through the Sorel into the St. Lawrence. The Great Salt Lake, in Utah, is about 70 miles in length by 30 in breadth.

Climate.—The United States have a great diversity of climate. It may generally be characterised as moist and variable. In the S. it partakes of a tropical nature, while in the north a severe winter lasts for four or five months in the year. The coasts of the Pacific are much milder than those of the Atlantic under the same parallels. The climate of California is as mild as that of Italy, and in the S. very much resembles that of a tropical country; whereas on the Atlantic coast the temperature is about ten degrees colder than in Western Europe under the same latitudes. On the plateaus of Utah and New Mexico we find a climate similar to that of the plains of Tartary. North of N. lat. 42° the climate is especially adapted to the growth of winter grains; between 42° and 36° Indian corn and winter grains are staples; while S. of 36° cotton, rice, sugar, Indian corn, and some of the tropical fruits are produced. The N.E. states are unhealthy and disagreeable in spring from the prevalence during that season of chilling E. winds blowing from the Atlantic. The northern and central states are subject to great and sudden variations of climate, in consequence of cold blasts from the great ice plains of the N. rushing in on any considerable augmentation of heat, there being no protecting mountain-chain on the N. Nor are the southern states entirely free from these sudden changes, when periods of unusually cold weather and unseasonable frosts not unfrequently destroy the orange buds of Florida and the cotton blossoms of the other southern states.

Minerals.—The mineral resources of the United States have as yet been but imperfectly explored. Coal and iron are widely distributed, and lead, copper, and tin are abundant. The Wisconsin and Illinois lead-mines are the richest in the world. Gold is very abundant in California, and is found also in Carolina, Virginia, and other states. Mercury is found in Kentucky, Ohio, and the borders of the great lakes. Petroleum has recently been found in great abundance in certain parts. Salt is obtained from numerous springs, especially in the State of New York.

Agriculture and Manufactures.—The great body of the people are employed in agriculture. The principal crops are oats, wheat, rye, maize, buckwheat, barley, potatoes, sugar, cotton, tobacco, rice, hemp, and flax. Cotton is grown chiefly in South Carolina, Georgia, Alabama, and Mississippi; and less abundantly in Louisiana, Arkansas, Texas, Tennessee, North Carolina, Virginia, Florida, and Kentucky. The amount produced in 1860 was 2,160,000,000 lbs., of which 1,767,686,338 lbs. were exported; but in 1862 the quantity exported was only 5,064,564 lbs. Sugar is grown chiefly in Louisiana, Florida, and Texas; rice in South Carolina and adjoining states; hemp in Kentucky and Missouri; and tobacco in Kentucky, Virginia, Tennessee, and Maryland, chiefly. In 1860 there were 163,261,389 acres of improved land in the States, and the cash value of farms £1,385,598,439; of farming implements and machinery, £51,464,061. The live stock comprised 6,115,458 horses, 1,129,553 asses and mules, 8,728,862 milch cows, 2,240,075 working oxen, 14,671,400 other cattle, 23,317,756 sheep, 32,555,267 swine—the total value of live stock being £230,727,128. The produce of that year in wheat was 171,183,381 bushels, rye 20,976,286, maize 830,451,707, oats 172,554,688, rice 187,140,173 lbs., tobacco 429,390,771 lbs., peas and beans 15,188,013 bushels, potatoes 153,277,503, barley 5,167,015, buckwheat 17,664,914, hops 11,010,012 lbs., flax 3,783,079 lbs., maple sugar 38,863,884 lbs., cane sugar 302,205,000 lbs.; besides butter 460,509,854 lbs., cheese 105,875,135 lbs., wool 60,511,343 lbs., wine 1,860,008 gals., honey 25,028,991 lbs. The mines produced 2,514,282 tons of iron ore, 9,398,332 tons of anthracite and 5,775,077 tons of bituminous coal, 2348 tons of nickel, 11,800 of zinc, 11,000 of lead, and 14,432 of copper ore. The total value of the manufactures produced in 1860 was £396,000,000, and the number of persons employed in the manufactures was 1,100,000 males and 285,000 females, each maintaining on an average 2½ other individuals, making the entire number of persons dependent on the manufactures 4,847,500, or nearly one-sixth of the whole population. The quantity of pig-iron produced was 884,474 tons, of bar and other wrought iron 406,298 tons. The value of steam-engines and machinery produced was £9,824,698; the number of sewing-machines made was 116,330. The value of the produce of flour and meal mills was £46,488,410. The manufacture of spirituous liquors employed 1138 distilleries, besides a large number of rectifying establishments; and 970 breweries, which produced 3,239,545 barrels of beer. The number of hands employed in the cotton manufactures was 45,315 males and 73,605 females, the number of spindles 5,035,798, and the value of goods produced £23,987,068. The woollen manufacture employed 28,780 males and 20,120 females, and the value of woollen and mixed goods produced was £14,347,075. Leather, boots and shoes, clothes, linen and silk goods, furniture, jewellery, timber, salt, petroleum, are among the chief of its other products.

Commerce.—The total value of exports to foreign countries for year ending 30th June 1860 was £69,495,011, and imports £73,670,024. In 1862-63 the exports were £69,126,970, and the imports £52,539,080. The number of vessels that left for foreign countries during the year 1859-60 was 23,594, having in all a burden of 8,789,929; that entered from foreign countries 22,031, burden 8,275,196 tons. The aggregate burden of vessels belonging to the United States in 1860 was—registered sailing, 2,448,941; steam, 97,296 tons: enrolled and licensed sailing, 2,036,990; steam, 770,641 tons. The vessels built in the year 1859-60 were 110 ships and barques, 36 brigs, 372 schooners, 289 sloops and canal boats, and 264 steamers—total, 1071 vessels, of in all 212,892 tons burden. The aggregate commercial movement of the United States can scarcely be estimated. The exports and imports at the several lake-ports alone were larger than those at the sea-ports in connection with foreign countries; and the tonnage of the canals and railroads in the State of New York was more than equal to that of the shipping employed in sea commerce. The coast navigation line, including the bays and islands, is estimated at 21,856 miles; that of the rivers, to the head of the tide, at 11,213, and that of the lakes at 4000. Most of the rivers are navigable far above the tide, and many of them nearly to their sources. Canals are comparatively few in number, and including those in California, which are chiefly used for mining operations, are under 6000 miles in length. Railway communication, however, is rapidly extending in all directions, and in 1863 there were 33,860 miles in operation.

Government, etc.—The government is a federal democratic republic, the fundamental principles of which are, that while each of the several states retains the separate sovereignty of its own territory, the general affairs of the Union, and more especially the relations of commerce, war, and peace with other nations, are entrusted to a general government, consisting of a president, vice-president, and a congress or parliament. This last comprises a senate and a house of representatives, the former made up of two members from each of the states, elected for six years; the latter of in all 241 members, elected for two years by the different states, in the ratio of their respective populations. The executive power is vested in the president, who is elected for four years by an electoral college chosen by popular vote, or by the legislatures of the several states, the number elected being equal to the number of senators and representatives of each of the states. The administration is conducted by several secretaries and other officers, who form the cabinet. There are secretaries of state, war, navy, treasury, and interior, a postmaster-general, and an attorney-general, each of whom presides over a separate department. The governments of the several states are perfectly analogous to those of the Union, the chief administrative offices in each being a governor, while the legislative power is vested in a congress popularly elected. The amount of public revenue for year ending 30th June 1861 was £17,334,728; expenditure, £17,620,590; public debt, £55,737,507. In 1863 the revenue was £185,036,070; expenditure, £183,941,811; and the public debt, £225,624,883. In 1864 (30th June) the public debt amounted to £346,397,667. The navy of the United States in 1864 consisted of 588 vessels, having in all 4443 guns; the army is estimated at about 800,000. There is no established religion in the United States; every one is free to profess what religion he chooses. The prevailing sects are Methodists, Baptists, Presbyterians, Congregationalists, Episcopalians, Lutherans, and Roman Catholics. In 1860 there were nearly 5,000,000 receiving instruction at the various educational institutions of the country.

In 1861 a secession took place of certain of the Southern and slave-holding States, and in February of that year the Confederate delegates met at Montgomery and adopted a constitution for the provisional government of the seceded states, Jefferson Davis, president. The form of government adopted was similar to that [redacted] United States. The states that seceded were—South Carolina, Georgia, [redacted]bama, Mississippi, Louisiana, Texas, Virginia, Arkansas, North Carolina, [redacted]. The total revenue for the six months ending 31st March 1864 [redacted]2,656; expenditure, £61,656,544; debt (funded and unfunded), [redacted]usive of foreign loans. The army is given at 549,226 men.

[redacted]—The United States territory comprises at present thirty-five sove-[redacted]tes, one federal district, nine organised territories, and the Indian territory, as in the following table, which gives the total population, as well as the number of slaves and free persons of colour, in each of these divisions in 1860:—

States.	Area in Square Miles.	Population in 1860. Total.	Free Coloured.	Slaves.	States.	Area in Square Miles.	Population in 1860. Total.	Free Coloured.	Slaves.

Missouri	67,380	1,182,012	3,572	114,931					

This population does not include the Indians, the number of whom within the territory is estimated at 204,430. The following table gives the total population at each decennial period since 1790:—

Years.	White.	Free Coloured.	Slaves.	Total.	Years.	White.	Free Coloured.	Slaves.	Total.
1790	3,172,464	59,466	697,897	3,929,827	1830	10,537,378	319,599	2,009,043	12,866,020
1800	4,304,489	108,395	893,041	5,305,925	1840	14,195,695	386,303	2,487,455	17,069,453
1810	5,862,004	186,446	1,191,364	7,239,814	1850	19,553,068	434,495	3,204,313	23,191,876
1820	7,861,937	238,156	1,538,038	9,638,131	1860	26,975,575	488,005	3,953,760	31,445,080

The population of the principal towns in 1860 was—New York, 805,651; Philadelphia, 562,529; Brooklyn, 266,661; Baltimore, 212,418; Boston, 177,812; New Orleans, 168,675; Cincinnati, 161,044; St. Louis, 160,773.

MEXICO.

Mexico is situated between lat. 15° 58′ and 33° 22′ N., and long. 86° 42′ and 117° 13′ W., having on the N. the states of California, New Mexico, and Texas; E., the Gulf of Mexico and the Caribbean Sea; S., British Honduras and Guatemala; and S.W. and W., the Pacific Ocean. Its greatest length in a N.W. and S.E. direction is about 1987, and its greatest breadth 1128 miles. Area, 802,416 square miles. The surface is extremely varied. It is traversed throughout its entire length by the great chain of the Cordilleras, which, on entering this territory from Guatemala, divides into two branches, one going along the coast of the Pacific, the other along that of the Gulf of Mexico, and enclosing between them a vast table-land from 6000 to 8000 feet in elevation, and comprising three-fifths of the entire territory. Many of the mountains are active volcanoes, and some of them, as Popocatepetl, rise to upwards of 17,000 feet in height. Its lakes are numerous, but small; and, with the exception of the Rio Grande on its N.E. frontier, none of of its rivers are of great size. This territory is particularly rich in minerals. The

value of the silver annually produced from the mines is about £7,000,000; of gold, £500,000. Iron, copper, tin, lead, zinc, and antimony are also abundant. The climate is usually divided into hot, temperate, and cold. The first has a mean annual temperature of about 77°, and prevails on the coasts and those parts under 2000 feet in elevation; the second of 68° to 70° prevails on the mountain-slopes, between 2500 and 5000 feet in elevation; and the third about 62° on the table-land, and all places above 5000 feet. The soil is rich and fertile, though a considerable portion of it is unfit for cultivation. About seven-eighths of the inhabitants are engaged in agriculture. Manufactures have as yet made very little progress, and are chiefly domestic. The commerce is very limited. The aggregate value of the exports and imports does not exceed £5,000,000. The army consists of about 16,000 men, with 520 officers; the navy of nine small vessels, carrying in all 35 guns. The public revenue in 1856 was £1,770,833; expenditure, £2,817,981; debt, £27,817,550. Mexico was formerly a federal republic comprising 19 states; but being overrun by French troops, it was induced to offer the crown to Maximilian, brother to the Emperor of Austria; and he accordingly assumed the reins of government 12th June 1864, with the title of Emperor. The established religion is the Roman Catholic Apostolic, and none other is tolerated by law. Education is in a very backward state; but of late some progress has been made, and a number of primary and other schools have been established by the States. Population (1857), 8,137,853.

CENTRAL AMERICA.

Central America lies between 8° 5′ and 17° 45′ N. lat., and 81° 44′ and 94° 14′ W. long., being about 900 miles in length from S.E. to N.W., and varying in breadth from 80 to 400 miles. Area, about 217,000 square miles. A range of no great elevation extends through the country, dividing it into two unequal portions, the smaller being on the side of the Pacific. The course of this range is interrupted in several places, especially by two cross valleys, one of which contains the lake of Nicaragua, the other the plain of Comayagua. The surface from the base of the mountains to the coast on each side is mostly of alluvial formation. Some of the summits of the range rise to the height of 12,000 or 13,000 feet, and many of them are volcanoes. The rivers are comparatively small, but the coast on both sides is deeply indented by gulfs and bays, forming numerous excellent harbours. The principal lakes are Nicaragua and Managua. There are mines of gold, silver, and iron; and lead, mercury, and other metals are also abundant. The climate, like that of Mexico, is exceedingly various, and the vegetable productions belong both to the torrid and temperate zones. The forests are extensive, and produce mahogany, pimento, sarsaparilla, vanilla, Peruvian balsam, and various other valuable woods and drugs. The chief employments of the people are agriculture and cattle-rearing. The country is divided into five independent states; the Mosquito territory, a kingdom under the protection of Britain; and the small territory of Belize, or British Honduras. The five republics have together an area of about 177,000 square miles, and an estimated population of 2,168,000, as follows:—Guatemala, area 28,000, population 972,000; Salvador, area 13,000, population 363,000; Honduras, area 72,000, population 358,000; Nicaragua, area 48,000, population 260,000; and Costa Rica, area 16,000, population 215,000. The Mosquito territory has an area of about 23,000 square miles, and a population of about 6000; and the colony of British Honduras has an area of 17,000 square miles, and a population of 25,637.

WEST INDIES.

The West Indies consist of four large and about forty smaller islands, besides numerous islets lying in the Atlantic, and extending from the coast of Florida in North America to that of Venezuela in South America, between 10° and 28° N. lat., and 59° and 85° W. long. They are usually divided into three groups—the Lucayes, or Bahamas, and the Great and Lesser Antilles. The Bahama group, comprehending fourteen larger and innumerable smaller islands and keys, are chiefly of coral formation, low, flat, and scantily covered with soil. Most of them are uninhabited. The Greater Antilles are—Cuba; Hayti, or San Domingo, sometimes called also Hispaniola; Porto Rico; and Jamaica. The Lesser Antilles consist of a long chain, extending in a curved line from Porto Rico to the Gulf of Paria, and called the Windward Islands; and of a smaller and more scattered group along the coast of Venezuela, called the Leeward Islands. These names, however, are more usually given to the islands of the former chain only, those to the N. of Dominica being called Windward, those to the S., Leeward. Most of these islands contain isolated peaks or mountain-ranges, supposed to be the summits of a submarine range of mountains. The West Indies, with the exception of the more northerly of the Bahamas, lie within the tropics, and are consequently subject to great heat, which, however, is modified by the sea-breezes, and in some of them by the elevation of the land. The interior highlands of Cuba, Hayti, Jamaica, and Porto Rico enjoy throughout the year a mild temperature, as do also several of the smaller islands; but the lowlands, subject to the combined influence of heat and moisture, are generally considered unhealthy. Ice sometimes forms in Cuba after a long continuance of north wind, but snow never falls. The rich and varied productions of the West Indies give them an important place in the commercial world. To their valuable native plants art and industry have added others not less valuable. The sugar-cane, coffee, pimento, banana, pine-apple, maize, cassara, manioc, cocoa, tobacco, cotton; various dyewoods and stuffs, as fustic, logwood, indigo, cochineal; medicinal plants, as liquorice, arrowroot, ginger, jalap, ipecacuanha, mahogany, and lignum-vitæ, are among the vegetable productions. The cattle are generally of a small size, and only a few of the islands contain sheep and goats. There are few wild animals. The cayman and various other lizards and snakes are common. Fish and turtle are abundant. Parrots, flamingoes, and humming-birds are also common. The following table gives the area and population of the separate islands:—

	Square Miles.	Population.		Sq. Miles.	Population.		Square Miles.	Population.
I. Spanish.			IV. Dutch.			VII. British.		
Cuba	47,278	1,449,462	Curacoa	138	19,045

SOUTH AMERICA.

This continent lies between 12° 30′ N., and 56° 30′ S. lat., and 34° 30′ and 81° 45′ W. long., and is bounded N. by the Caribbean Sea, N.E. and E. by the Atlantic, and W. by the Pacific Ocean; having a length from N. to S. of 4900 miles, and a breadth of 3200. Area estimated at 6,764,677 square miles. Its form is peninsular, being surrounded by sea on all sides except in the N.W., where it is connected with N. America by the Isthmus of Panama. The coast has very few indentations, the chief of which being the Gulfs of Darien, Venezuela, and Paria, in the Caribbean Sea; the estuaries of the Amazon, Orinoco, and La Plata, in the Atlantic; and the Gulf of Guayaquil and Bay of Panama in the Pacific. The length of the coast-line of S. America is about 16,800 miles.

Mountains.—South America is remarkable for its lofty mountains and enormous plains. The mountains form four distinct ranges, the chief of which is that of the Andes, extending from N. to S. along the W. coast of the continent, about 4400 miles in length, but of inconsiderable width. The highest peak is Tunpangato in Chili, 22,450 feet high. The southern extremity of these mountains form a group of mountainous islands called the Archipelago of Tierra del Fuego. Stretching eastward from the N. extremity of the Andes are the mountains of Venezuela and Guiana, the former extending along the coast, the latter running parallel to it, and forming the boundary between the plains watered by the Orinoco and Amazon. The principal summits of these chains rise to upwards of 8000 feet above the sea. The mountains of Brazil consist of several parallel chains, extending from N.E. to S.W. between 18° and 25° S. lat. The plains of S. America are of vast size, and are known by the various names of the *pampas* of the Argentine country, the *silvas* of the Amazon, and the *llanos* of the Orinoco. The pampas are about 1000 feet above the sea, and have an area of 300,000 square miles. The silvas, as their name indicates, are densely wooded, and occupy the centre of the continent, having a length of 1500 miles and a breadth varying from 300 to 800. The llanos of the Orinoco are perfectly flat, and occupy 150,000 square miles. Besides these, there is the desert of Patagonia in the S. of the continent, nearly 200,000 square miles in extent.

Rivers and Lakes.—The largest river is the Amazon, which rises in the table-land of Pasco in Peru, flows eastward, and after a length of about 4000 miles, falls into the Atlantic at the equator by an estuary 96 miles in breadth. It is navigable for 2200 miles from its mouth, and receives during its course the Ucayali, Madeira, Tapajos, Xingu, Negro, and Tocantins. The Orinoco, which is connected by a natural canal with the Negro, rises in the mountains of Guiana, flowing first N. and then E., falls into the Atlantic by several mouths, after a course of 1300 or 1400 miles. The Parana rises in the mountains of Brazil, and flows southwards till it forms, along with Uruguay, the estuary of La Plata. The principal tributary of the Parana is the Paraguay. Among the smaller rivers are the Magdalena, Essequibo, San Francesco, Colorado, Negro, etc. The only lake of great size in S. America is Siticaca, on the frontiers of Peru and Bolivia, which has an area of 4600 square miles, and is 12,795 feet above the level of the sea.

Climate.—In no part of South America is the temperature so hot as its geographical position would indicate. The whole of the valley of the Amazon, though lying almost directly under the equator, is tempered by the cool trade winds from the E., which follow the course of that river as far as the Andes. The warmest part of the continent is the steppes of Caracas, and here the thermometer rises to 98° in the shade. The climate of Brazil and the adjoining countries is mild and temperate; at Rio Janeiro the mean temperature is 74°, and at Buenos Ayres 68°. In the S. of the continent the heat is never above 43° or 46°, and snow falls almost daily. Along the W. coast, between the 7th and 32d degs. of latitude, there is a rainless district nearly 1000 miles in length, caused by the condensation of the sea vapours on the Andes.

Vegetable Productions.—The chief characteristic of S. America in this respect is its immense forests, which occupy about two-thirds of its surface. They differ in several respects from those of the Old World; the trees are more various and graceful, and many even of the largest of them are adorned with the most brilliant flowers. Throughout the whole of this tropical region the magnitude of the trees and the brilliancy of the flowers are extraordinary. Fruits also abound, including oranges, cocoa-nuts, bananas, pine-apples, mangoes, pomegranates, etc. Further to the S. the quassia plant, the tinga bean, the cinchona tree, and rosewood, are met with, as well as indigo, coffee, sugar, maize, etc. The vegetation, as we proceed southwards, gradually acquires a more Arctic character, till it consists of nothing but mosses and lichens.

Animals.—The jaguar is the most formidable beast of prey peculiar to this continent, and the puma is common to it with N. America. The principal native domesticated animals are the lamas and pacos; but horses, oxen, sheep, etc., have been introduced from Europe, and are now common. Monkeys and apes abound in the forests. Among winged mammals is the vampire, which attacks even the largest animals. Boa-constrictors are found in the swamps and marshes; and ants mosquitoes, and locusts are in many parts numerous. Among birds, the condor, a

species of vulture of enormous size, frequently measuring ten or fourteen feet from wing to wing, is the most important in S. America; while eagles, vultures, falcons, and many birds of very beautiful plumage, are also found. These last are found in greater abundance in Brazil than in any other part of the world.

Minerals.—The great mineral-producing countries of South America are Peru, Bolivia, and Chili. Silver is the principal product, but gold and other metals are also found; and in Chili copper is very abundant. The province of Minas Geraes, as its name implies, is rich in mines of gold, silver, diamonds, etc. The more useful minerals are very generally diffused over the continent.

The following are the principal states of S. America:—

VENEZUELA is situated between 1° 12′ and 12° 16′ N. lat., and 59° 42′ and 73° 17′ W. long.; and is bounded on the N. by the Caribbean Sea and the Atlantic, E. by the Atlantic and British Guiana, S. by Brazil and New Granada, and W. by New Granada. It is about 860 miles in length by 500 in average breadth, and has an area of 426,712 square miles. The northern and southern portions of the country are mountainous, but the central portion belongs to the great basin of the Orinoco. The vegetation is extremely rich and varied, the low lands abounding in tropical plants, and the summits of the mountains in those of the Arctic regions. The staple productions are coffee, cocoa, indigo, sugar, cotton, tobacco, and cochineal. Though not ranking among the mineral-producing countries of South America, Venezuela is not deficient in this respect. Some gold and silver are got from the mountains in the W. of the republic; but the most important mineral production is copper, which is found in the hills of San Felipe, near the N. coast. Coal, salt, and asphalt, are also obtained in the northern districts. Mining operations, however, are but little carried on. The inhabitants of the N. are chiefly employed in agriculture, and those of the S. in pasturage. The implements of husbandry, however, are of a rude nature, and manufacturing industry is in a low condition. The commerce is considerable, being in general upwards of £3,000,000 in value annually. The form of government is republican, the chief power being vested in a president and a congress composed of a house of senators and a house of representatives. The country is divided into fifteen provinces, each of which has a provincial legislature. The capital is Caracas. The religion of Venezuela, like that of all the other American states, except the British and Dutch settlements, is Roman Catholic. Population (1858), 1,565,000.

NEW GRANADA, or the *United States of Columbia*, is situated between 12° 21′ N. and 3° 35′ S. lat., and between 65° 52′ and 83° 5′ W. long.; being bounded N. by the Caribbean Sea, E. by Venezuela and Brazil, S. by Ecuador, and W. by the Pacific. It is about 1000 miles in length by 760 in greatest breadth, and has an area of 521,948 square miles. Agriculture holds the first place in the industry of New Granada. The chief productions are rice, cotton, tobacco, sugar, maize, wheat, etc.; but the cultivation of the soil is very carelessly carried on, and only a very small portion of it has been reclaimed. In the *llanos*, towards the E., large quantities of horses and cattle are reared. The country is rich in minerals, as gold, silver, platina, copper, iron, lead, coal, etc.; but mining is not carried on to any great extent, a silver mine at Santa Anna being the only one now worked. Gold is collected in a few places. Manufactures can hardly be said to exist in New Granada, the few articles that are made not being sufficient to supply the wants of the people. The imports amount in value to about £900,000, and the exports to £700,000. Steamers ply on the Magdalena; and there is a railway across the Isthmus of Panama, from Aspinwall to Panama. A new constitution was sanctioned in 1863. Each of the states is in the management of its local affairs independent of the rest, and the general affairs of the Union are to be managed by a president and a congress elected by the several states. Population (1858), 2,223,600. Capital, Bogota.

ECUADOR is situated between 1° 40′ N. and 5° 50′ S. lat., and between 68° 20′ and 81° 12′ W. long.; being bounded on the N. by New Granada, E. by Brazil, S. by Peru, and W. by the Pacific. It is about 800 miles in length by about 430 in breadth, and has an area of 287,638 square miles. Gold is said to have been obtained in former times in this country, and silver and other ores are believed to exist; but no mines are at present worked except those of iron and copper. The people are chiefly engaged in agriculture, and the principal crops are corn in the high valleys, and sugar, tobacco, and cotton in the lower regions. Horses, cattle, sheep, etc., are reared in large numbers. The manufactures of Ecuador were formerly more considerable than those of any other country of S. America, but they have now much fallen off. The exports in 1856 amounted in value to £498,148, and the imports to £497,341. The chief seat of the commerce of Ecuador is Guayaquil on the Pacific. The government is republican; the legislature consists of a single house, and the executive is in the hands of a president. The revenue for 1858 amounted to £198,350, and the expenditure to £200,000. Ecuador is divided into three departments, and subdivided into seven provinces. The capital is Quito, and the population 1,040,371.

GUIANA is bounded on the N. and E. by the Atlantic, S. by Brazil, and W. by Venezuela. It comprises British, Dutch, and French Guianas. *British Guiana*, which occupies the western part of the country, has an area of 96,000 square miles, and is divided into three districts—Demerara, Essequibo, and Berbice. The imports in 1860 amounted to £1,145,959, and the exports to £1,513,452. The revenue for the same year was £279,952, and the expenditure £314,858. The capital is Georgetown. Population, 127,695. *Dutch Guiana* occupies the centre of the country, and has an area of 59,765 square miles. The exports and imports together amounted to about £500,000; and the revenue and expenditure are each about £90,000 annually. Population, 69,200. *French Guiana* occupies the eastern part of the country, and has an area of 22,500 square miles. It is divided into two districts, Cayenne and Sinnamory, and into fourteen communes. The exports and imports together amount to between £500,000 and £600,000 annually. The capital is Cayenne. Population, 27,840.

BRAZIL is situated between 4° 23′ N. and 32° 45′ S. lat., and between 34° 56′ and 73° 20′ W. long.; being bounded on the N. by Venezuela and Guiana; E. by the Atlantic; S. and W. by Uruguay, the Argentine Confederation, Paraguay, Bolivia, Peru, Ecuador, and New Granada. Its greatest length from E. to W. is 2630 miles; greatest breadth, 2540; area estimated at 3,100,104 square miles. Brazil is very rich in minerals, as gold, silver, iron, diamonds, topazes, and other precious stones. Gold is chiefly obtained by washing; but iron and other mines are worked in Minas Geraes. Agriculture, however, is the principal occupation of the inhabitants. Cattle are very numerous, and are valued mainly for their hides. The manufactures are of little importance. The value of the exports in 1860 was £12,706,876; of the imports, £12,557,551. The government is a constitutional monarchy, hereditary in the male line; and the legislature consists of a senate and a chamber of deputies, the former elected for life, the latter for four years. The public revenue in 1860 was £5,295,464, the expenditure £6,075,595, and the total amount of public debt £15,283,926. Brazil is divided into twenty provinces, and the capital is Rio Janeiro. Population (1856), 7,677,800.

PERU is situated between 3° 35′ and 21° 48′ S. lat., and between 68° 10′ and 81° 30′ W. long.; being bounded on the N. by Ecuador, E. and S. by Brazil and Bolivia, and W. by the Pacific. Peru is very rich in gold and silver; and though a great number of the inhabitants are employed in mining operations, these are not carried on with that energy and skill which is necessary to their full development. The total produce of the silver mines since 1630 is valued at more than £300,000,000. Agriculture is here subject to many difficulties and disadvantages, arising from the dryness of the land near the coast, the barrenness of the higher regions, and the difficulty of communication with the interior; but notwithstanding these disadvantages, the soil furnishes a considerable supply of productions for exportation. Manufactures can hardly be said to exist. The trade is considerable; the exports in 1859 amounted to £3,343,134, and the imports to £3,063,844. Several short lines of railway have recently been constructed in Peru. The government is republican, and the chief executive power resides in the president, while the legislature consists of a senate and chamber of deputies. Peru is divided into eleven departments and two littoral provinces. Population (1859), 2,500,000.

BOLIVIA is situated between 10° 21′ and 25° 38′ S. lat., and between 57° 36′ and 70° 30′ W. long.; being bounded on the N. and E. by Brazil, S. by the Argentine Confederation and Chili, and W. by the Pacific and Peru. Its length is about 1000 miles, its greatest breadth about 760, and its area 473,798 square miles. Gold is found in Bolivia in abundance, especially on the eastern slopes of the Andes; and the silver mines of Potosi in Bolivia have long been regarded as the richest in the world. Copper, lead, tin, sulphur, saltpetre, and salt are also found in Bolivia. The chief occupation of the people is agriculture; and though there are numerous manufactories, none of them are of great size. The trade is inconsiderable, and is chiefly carried on through Peru. The constitution is republican: the executive is in the hands of a president; and the legislature consists of three branches, a senate, tribunes, and censors. The revenue amounted in 1858 to £395,200, and the expenditure to £347,800. The capital is Chuquisaca. The country is divided into seven departments and two provinces, and contained in 1858, 1,987,352 inhabitants.

The ARGENTINE CONFEDERATION is situated between 22° 20′ and 40° 56′ S. lat., and 55° 20′ and 70° 30′ W. long.; being bounded on the N. by Bolivia; E. by Paraguay, Brazil, and Uruguay; S. by Patagonia; and W. by Chili. Length, about 1260 miles; average breadth, 760; area, 786,000 square miles. Gold, silver, copper, and iron are found in the western part of this country; but the chief wealth of the nation consists in the immense herds of cattle fed on the pampas. Agriculture is but little attended to. There are few manufactures, but the trade is considerable; the imports in 1861 amounted to £5,600,000, and the exports to £3,400,000. The states of the Confederation are severally independent, and the only bond of union between them is in relation to foreign affairs. The Confederation consists of fourteen provinces. Population (1859), 1,171,800. The chief town is Buenos Ayres.

PARAGUAY is situated between 21° 20′ and 27° 18′ S. lat., and 54° 23′ and 58° 16′ W. long.; and is bounded N. and E. by Brazil, S. and W. by the Argentine Confederation. Length about 416 miles; average breadth, 180; area, 72,106 square miles. The surface is mountainous in the N.E., flat in the centre, and marshy in the S.W. The soil is fertile, and watered by numerous streams. The inhabitants are chiefly engaged in agriculture. The principal products are tobacco, maize, mandioca, cotton, rice, sugar, Paraguay tea, oranges, and timber. The exports of 1860 are estimated at £338,780, the imports at £173,168. Population (1857), 1,337,431. The chief town is Asunçion.

URUGUAY is situated between 29° 20′ and 34° 58′ S. lat., and 52° 38′ and 58° 31′ W. long.; and is bounded N. by Brazil, E. by the Atlantic, S. by the estuary of La Plata, and W. by the Argentine Confederation. Length about 380 miles; breadth, 260; area, 73,538 square miles. The surface along the coast is level, and inland it is mostly undulating, except in the centre, where it is mountainous. Vast forests abounding with wild beasts occur in the interior. The people are chiefly pastoral in their pursuits, and the government is republican. Population (1860), 240,965. Capital, Monte Video.

CHILI extends along the W. coast of S. America, from 24° to 55° 59′ S. lat., and from 68° 56′ to 74° 35′ W. long., being bounded N. by Bolivia, E. by the Argentine Confederation, S. by Patagonia and the Pacific, and W. by the Pacific. Length, 2140 miles; greatest breadth, 210; area, 218,925 square miles. Chili is rich in minerals, especially in various kinds of metals, the principal of which are gold, silver, and copper. In the last of these Chili is superior to every other country in the world. Quicksilver, iron, coal, lead, and tin are also found. The people of Chili are chiefly employed in agriculture, which they pursue with great industry and success, though in a great measure unacquainted with the recent improvements. Chili is the native country of the potato, which is extensively raised here. The manufactures are still in their infancy, but commerce is carried on to a considerable extent. The value of the imports in 1860 was £5,352,839; of the exports, £5,090,236. The government is republican; the executive power being vested in a president, elected every five years, and a council of state; the legislative power being in the hands of a senate of twenty members, retaining office for nine years, and a chamber of deputies, elected for three years, in the proportion of one for every 20,000 inhabitants. The revenue for 1860 amounted to £1,498,950, and the expenditure to £1,501,405. The country is divided into fifteen provinces, and the capital is Santiago. Population (1857), 1,558,319.

PATAGONIA, a dreary and sterile country, inhabited only by the aborigines, occupies the extreme S. of South America. It is divided by the Andes into two parts, that to the E. being claimed by the Argentine Confederation, and that to the W. by Chili. The inhabitants are tall and stout, and with a reddish-brown complexion. To the S. of the mainland, and separated from it by the Straits of Magellan, lies *Tierra del Fuego*, a group of islands of the same appearance and character as Patagonia, at the S. extremity of which is *Cape Horn*. Eastward of Patagonia are the *Falkland Islands*, where an establishment is kept up by the British for supplying with provisions vessels rounding Cape Horn.

AUSTRALASIA.

THIS great division of the globe consists of Australia, Tasmania, Papua, New Zealand, and numerous smaller islands lying between the equator and 55° S. lat., and between 112° and 175° E. long. Australia is the largest island in the world, and lies between 10° 43′ and 39° 11′ S. lat., and 112° 55′ and 153° 37′ E long. Its length, from Cape Byron on the E. coast to Cape Inscription on the W., is 2600 miles; its greatest breadth, from Cape York on the N. to Wilson Promontory on the S., is 1960 miles; and its area is about 2,690,800 square miles. The coast presents very few irregularities; the principal gulfs are those of Carpentaria on the N., and Spencer on the S.; while Harvey Bay on the E., Shark's Bay on the W., and the Gulf of St. Vincent on the S., are of inferior size. On the N. and E. coasts, however, there are numerous creeks and harbours of considerable size; but a great part of the S. and W. coast presents few indentations.

Surface and Climate.—The principal mountain-chain is the Australian Alps, in the S.E. part of the island, and stretching in a N.N.E. direction from Wilson Promontory, at the distance of from 50 to 100 miles from the coast. Parts of it are known as the Blue Mountains and the Liverpool range. The height of this range in the S. is estimated at 1500 feet, the highest known summits, Mounts Kosciusco and Hotham, reaching respectively 6510 and 7500 feet. The Australian Grampians extend northward from Portland Bay; and another range, called the Australian Pyrenees, connects this with the Australian Alps. In the W. of Australia there are three other ranges of mountains also extending from N. to S., the furthest W. of which is the most important, and is known by the name of the Darling-range. The interior of Australia consists of vast flat plains very deficient in vegetation. The most important of the rivers of Australia is the Murray, which rises in the Australian Alps, and flows towards the W., forming the boundary between New South Wales and Victoria. It receives from the right the Murrumbidgee, and its tributary the Lachlan; the Darling, and its tributary the Macquarie; and after a course of more than 1000 miles, falls into the Southern Ocean through a shallow lake called Lake Victoria. The rivers of Australia are more of the nature of mountain torrents than regular rivers; and while in the upper parts of their courses they are frequently of considerable size, they generally become narrow, shallow, and sluggish as they approach their mouths. The temperature of Australia is subject to great and sudden changes, and the thermometer sometimes varies as much as 25° within an hour. The climate, however, of the settled districts is very pleasant and salubrious, and considerably resembles that of Italy. Of the climate of the N. portion of the island lying within the tropics little is known, but from its situation and want of water, it may be inferred that it is parched with excessive heat. The southern portions are exposed every ten or twelve years to a season of extreme drought, which lasts sometimes as long as two years, and is succeeded by periods of excessive rain, which gradually diminishes in amount year after year, till it ceases altogether.

Productions, etc.—One of the characteristics of the vegetation of this island is its dissimilarity from that of any other part of the world. There is also a great deficiency in plants that are useful to man. The trees are almost all evergreens; and the timber is very inferior, being liable to rot. Eucalypti, or gum-trees, as they are called, are numerous, and from many of them gums and resins are obtained similar to those of Arabia. There are many flowers of great beauty and fragrance, but very few indigenous fruits; and corn, until introduced from Europe, was unknown. Many of the animals found here are peculiar to Australia. Among the more remarkable are the kangaroo and the ornithorhyncus, a four-footed animal with the bill of a duck. There are no such animals for utility as the horse, ass, ox, or sheep; and the fewness, both of the species and of the individuals of the species, is characteristic of this part of the world. The birds are no less singular than the beasts; white eagles and black swans abound; and the emu, which is a native of this island, is the largest bird in the world next to the ostrich. Serpents are numerous, but few of them are poisonous.

Minerals.—Iron is found in abundance throughout Australia and the neighbouring islands, but the mineral riches of this country have only recently been discovered. In 1842 the copper mine of Kassunda, in South Australia, was discovered and opened; and in 1845 the Burra Burra mine, one of the richest copper mines in the world, was discovered. The existence of gold in Australia was known as early as 1839, but no attention was paid to the fact until 1851, when large quantities of it were found near Bathurst, about 150 miles W. of Sydney. Since then, numerous other gold-fields have been discovered in New South Wales, Victoria, and, to a small extent, in South Australia. These deposits now extend from the Grafton range, in 26° S. lat. and 158° E. long., to Ballarat, in 37° S. lat. and 144° E. long.; and the main gold region of New South Wales alone has an area estimated at 16,000 square miles. The amount of gold exported from New South Wales in 1862 was 575,538 oz., and the value £2,212,534; from Victoria the amount was 1,658,285 oz., value £6,685,192. Silver has been found in small quantities, and coal is abundant in various districts, but chiefly near Hunter River, in New South Wales, where it is extensively worked.

The whole of Australia belongs to Great Britain, and is divided into the colonies of New South Wales, Victoria, South Australia, Western Australia, and Queensland.

NEW SOUTH WALES, in the S.E. of the island, has an area of about 323,437 square miles. The total acreage under crop in 1863 was 302,138—of which, wheat 117,854 acres, maize 78,232, sown grasses 32,010, barley and oats 50,000, potatoes 9282, gardens 8410, vineyards 1459. There were in that year 273,389 horses, 2,620,383 horned cattle, and 6,145,651 sheep. In that year 476,522 tons of coals were raised. The number of the ships which entered in 1862 was 1493, tonnage 454,837; that cleared 1568, tonnage 467,356. The imports amounted to £9,334,645, and the exports to £7,102,562. The number of schools was 925, with 42,211 scholars. The public revenue amounted to £1,628,885, and the expenditure to £1,608,810. The capital is Sydney. Population (1861) 358,278.

The colony of VICTORIA is situated to the S. of New South Wales, of which it formerly formed a part. Area 86,831 square miles. In 1862 there were 465,430 acres in cultivation. There were in the same year 86,067 horses, 576,601 horned cattle, 6,764,851 sheep, and 52,991 pigs. The number of vessels entered in that year was 1715, tonnage 556,188; the number that cleared 1766, tonnage 581,892. The imports amounted in value to £13,487,787, and the exports to £13,039,422. The number of schools was 989, and the number of scholars 65,541. The public revenue in that year amounted to £3,217,750, and the expenditure to £2,853,121. The capital is Melbourne. Population (1861), 321,724.

SOUTH AUSTRALIA, which lies about the centre of the S. coast, has an area of 383,328 square miles. The extent of cultivated land in 1862 was 494,511 acres, the principal crops being wheat, barley, oats, maize, and hay. The number of horses in 1862 was 56,251; of cattle, 258,342; sheep, 3,431,000. The imports for that year amounted in value to £1,820,656, and the exports to £2,145,796. The public revenue for 1862 amounted to £548,709, and the expenditure to £579,382. The capital is Adelaide. Population (1861), 130,627.

WESTERN AUSTRALIA occupies the W. part of the island, and has an area of 978,000 square miles. It had in 1861, 27,018 acres of land under cultivation, of which 14,189 were in wheat, 2821 in barley, 723 oats. The number of horses was 10,720; of cattle, 33,795; sheep, 279,576; swine, 11,984. The number of vessels entered in 1861 was 110, tonnage 57,456; that cleared 109, tonnage 57,800. The imports in that year amounted to £147,913; the exports to £95,789. The public revenue was £69,406, and the expenditure £72,267. The capital is Perth. Population (1861), 15,691.

QUEENSLAND comprises the whole of the north-eastern portion of the Australian continent, with the adjacent islands in the Pacific Ocean and in the Gulf of Carpentaria. It comprises an area of 678,000 square miles, and had in 1861, 34,367 inhabitants, exclusive of the aborigines, estimated at about 15,000. The climate is favourable to Europeans, and to the growth of wool and cotton. The mean annual temperature at Brisbane is 60° 7′. Pastoral pursuits are chiefly carried on. In 1862 there were 35,625 horses, 610,204 cattle, 4,345,901 sheep, and 7019 pigs. The amount of land under cultivation was 6067 acres, of which 739 were in wheat, 2767 in maize, 466 potatoes, 392 cotton, and 396 gardens. The imports were £1,320,225, exports £748,519; the revenue £346,431, expenditure £368,171.

TASMANIA, or VAN DIEMEN'S LAND, an island lying to the S. of Australia, between 40° 49′ and 43° 32′ S. lat., and between 144° 32′ and 148° 25′ E. long. Its form is triangular, its length about 170 miles, its greatest breadth 180, and its area about 26,215 square miles. The W. and S. coasts of this island are bold and precipitous; and the whole of the interior is diversified with hills and valleys, forests and meadows. The soil is fertile and well suited for cultivation, and the climate is healthy and temperate, resembling considerably that of England, but more regular. In 1861, 248,064 acres of land were under cultivation, of which 58,823 were in wheat, 29,022 in oats, 7279 barley, 9349 potatoes, 1989 peas and beans, and 31,837 hay. The domestic animals of Europe thrive well here; and in 1861 there were 22,128 horses, 87,114 horned cattle, 1,714,498 sheep. The principal minerals of the island are copper, iron, lead, coal, and slate; gold has been found here, but only in small quantities. The number of ships that entered in 1861 was 780, tonnage 113,610; that cleared 800, tonnage 116,698. The value of the exports was £905,463; of the imports, £954,517. The revenue in 1861 amounted to £315,733, and the expenditure to £337,941. The capital is Hobart Town. Population (1861), 90,211.

PAPUA, or NEW GUINEA, the second in size of the Australasian islands, is situated to the N. of Australia, between 0° 19′ and 10° 3′ S. lat., and between 130° 40′ and 148° 30′ E. long. Its length from N.W. to S.E. is nearly 1300 miles, its breadth varies from 18 to 500 miles, and its area is estimated at 260,000 square miles. The island has been very little explored, and little is known of its nature and productions. The principal vegetables are the screw pine, the sage palm, the cocoa-nut, the bread-fruit tree, and many of the valuable spices of the Moluccas. The principal animals are dogs, wild cats, and pigs, among quadrupeds; and the cassowary and bird of paradise among birds. Gold is believed to exist in the interior. Some trade is carried on by the Chinese on the N. coast, and by the people of Ceram Laut and the Goram Islands on the S. The island is very populous.

To the S.E. of Papua is situated the *Louisiadé Archipelago*, a cluster of islands which, like that island, are densely populated; and to the E. of Papua lie the islands of *New Britain* and *New Ireland* and *Solomon's Archipelago*.

To the S.E. of these, and between 14° 30′ and 20° S. lat., lie the *New Hebrides;* and S. of these again, between 20° 5′ and 22° 30′ S. lat., and 164° and 167° 40′ E. long., is *New Caledonia*, an island 280 miles long by 60 broad, which resembles New South Wales in its appearance and products.

NEW ZEALAND, which belongs to Great Britain, is a group, consisting of two principal and several smaller islands, extending in a curved line between 34° 25′ and 47° 20′ S. lat., and 166° and 179° E. long. Area, 106,259 square miles. The northern island is about 460 miles in length by 70 in breadth; and the southern is about 880 miles in length by 110 in breadth. A chain of mountains extends from the middle of the northern island to the S. extremity of the southern; and one peak in the latter has been roughly estimated at 14,000 feet high. The country is well watered by rivers on both sides of the mountain-range, and there are also numerous lakes. The hills are covered with forests of evergreens; but a great part of the western region is desolate and barren. The total extent of the cultivated land in 1861 was 226,621 acres, of which 29,547 were in wheat, 3458 barley, 15,876 oats, 7292 potatoes, 5868 gardens, etc., and 158,062 pasture. The principal indigenous animals are pigs, dogs, and rats; but many others have been introduced from Europe. There were in 1861, 28,275 horses, 193,285 horned cattle, 2,761,583 sheep. The number of vessels that entered in 1861 was 596, tonnage 197,986; that cleared 546, tonnage 205,350. The value of the exports was £1,370,247; imports, £2,493,811. The revenue in 1861 amounted to £671,500, and in 1862 had increased to £1,115,162. The capital is Auckland. Population (1861), 106,315.

The name of POLYNESIA is given to those islands in the Pacific Ocean which are sometimes included with Australasia under the name of OCEANIA. Of these there are several groups. The *Caroline Islands* lie N.E. of Papua about 50° N. lat., and are several hundreds in number, and are divided into many smaller groups. The *Sandwich Islands* are situated about 20° N. lat. and 160° W. long.; they are ten in number, and the largest, *Owhyhee*, has an area of 4300 square miles. The *Society Islands*, of which *Otaheite* is the largest, lie in S. lat. 15° and W. long. 150°. To the N.E. of these are the *Marquesas*, thirteen in number, of which the largest is *Munhiva*. The *Friendly Islands*, between 160° and 180° W. long. and about 15° S. lat., are the only others of importance in the Pacific.

PALESTINE
ACCORDING TO ITS
ANCIENT DIVISIONS.
BY W. HUGHES
Scale of Geographical Miles
English Miles
In all cases where a Scriptural site has been ascertained the modern name is added to the ancient one; from which it is distinguished by a hyphen: thus the Ancient names are marked as in parentheses thus Ashdod (Azotus) Jabneh. The word Jebel is the modern Arabic appellation for Mountain. Nahr for River & Wady for a Valley or Water course.
Reference to the Tribes
I Asher
II Naphtali
III Zebulun
IV Issachar
V Manasseh
VI Ephraim
VII Dan
VIII Benjamin
IX Judah
X Simeon
XI Gad
XII Reuben
The boundaries of the Tribes are indicated by a dotted line: thus ..... The territories of Judah, Simeon, and the great part of Benjamin and Dan, were other wards comprised in the Kingdom of Judah: all the remainder were comprehended within the Kingdom of Israel.
